Hallo programmers,

Please design for me this easy and straight forward project, I would like to have projected lines when **the second 4 hour candle of the day closes**, the line should be projected on the price around the upper and the lower body range of the candle and on the upper and lower wick price of the candle as you can see in the below picture. **The same concept should also be applied for the weekly candle as should in the second picture.**

Important

- **The lines on the 2nd 4hr candle should be displayed for the current day only**
- **The line on the previous week candle should only be displayed throughout the current week.**
- **The indicator should be able to alert the user when price touched one of the line 2nd 4H candle or previous week candle**
- **The indicator should also be able notify the user when a candle closes below or above one of the line**

Projected line on highest point of the previous weekly candle (wick)

Projected line on the opening price or upper body part of the previous weekly candle

Projected line on lowest point of the previous weekly candle (wick)

previous weekly circled

Projected line on closing price of the previous weekly candle (wick)
