Hi, I am looking for a passionate developer who can help me develop a MT5 Expert Advisor that is based on indicator signals by PipFinite. Welcome experienced and passionate developers who are able to develop, advise and improve the EA based on his/her experience in the field. Detailed description of the EA is in the file attached. Thanks for looking!

INDICATORS LIST

1. PipFinite Trend Pro
2. PipFinite Impulse Pro
3. PipFinite Breakout Edge
4. PipFinite Exit Edge
5. PipFinite Reversal Pro
6. PipFinite Binary Options Pro

The EA should be able to work with the Scanner that comes with each of these Indicators.

GENERAL IDEA

- The EA receives and responds based on signals from the PipFinite indicators listed above.
- The EA will automatically open Buy/Sell Orders based on the signals with a <u>minimum Success Rate of "x"</u>.
- If the signal is Buy, and the value is shot past above it, the Order will not be passed through.
- If the signal is Sell, and the value is shot past below it, the Order will not be passed through as well.
- Orders opened this way will have parameters automatically completed e.g. SL/TP based on user's settings.
- Pending Orders which are not fulfilled will be deleted when the signals change (from Buy/Sell and vice-versa).

USER SETTINGS

Users generally are allowed to set these:

1. **INDICATOR**
   Which indicator is the EA responding to?

2. **SUCCESS RATE**
   EA only opens a Buy/Sell Order based on the Success Rate indicated by the signal.

3. **RISK MANAGEMENT**
   - Type:
     o Global (whether settings in this portion affects the entire account).
     o Local (whether settings in this portion affects each traded instrument).
   - Max Order
   - Lot Size
   - Lot Size (Gold)
   - Stop Loss (SL):   Automatic (calculated by the EA), Indicator (if there is), % (Account, Session, Instrument), pips, $ value.
     o IF SL met on Global, EA stops until user reopens the Client.
     o IF SL met on Local, allow user to define "Time-Out" before EA resumes sending in Order.
   - Take Profit: TP1 (from Indicator), TP2 (from Indicator), TP Max (EA after hitting TP1, will try for TP2), TP Partial (EA will take half profit from TP1, and keep position open until it hits TP2).
   - Ultimatum: Button on Dashboard/Chat that Stops EA, deletes all pending orders, closes all positions once a % of account value is lost since EA started.
   - Expiry: When do pending Orders expire and gets deleted.

4. MARKETS TRADED

5. MAGIC NUMBER

VISUALS

- A movable dashboard that shows statistics of each Session.
- Current Timestamp
- EA Running – How long has the EA been running (Months, Weeks, Hours, Minutes, Seconds)
- Initial Deposit
- Account Balance: Current account's balance
- Profit/Loss
- Update on how much SL left for the session/day.

- Number of sessions
- Positions closed (in profit / in loss)
- Growth
- Drawdown

RESTRICTION AND CONTROL

I forsee I'll be needing Beta-Testers to test the EA prototype. Please include a "control mechanism"; example if I were to pass the EA to someone to test, the EA works for only 5 days, and is locked to the account number. So that before I pass them the EA to test, I set all the information needed.

EXPECTATIONS

- Functional prototypes to test if the EA behaves as how it is expected to be.
- Inclusive of fixes and improvements of the prototype so that it is fully functional as defined above.
- Developer able to suggest/give/add personal input based on his/her experience in the field.
- Professional and Quality EA.
- Long term support and enhancement opportunities.
- EA to be made exclusive.
- EA should run on MQL5 VPS, or any VPS flawlessly.
- Source Code given.
