

Logic of martingale pro

It is aimed to avoid the negatives of martingale and anti martingale

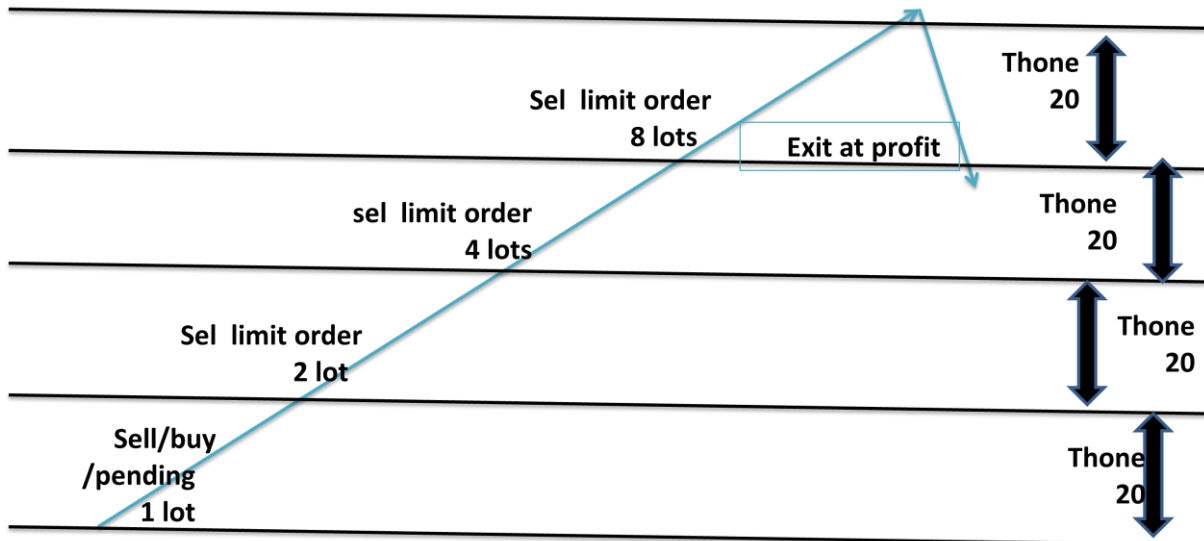

Martingale is aimed to open next order reverse direction if first order is in losses so if we have trend down and first order is buy we will still open buy orders every one step selected to have one point when the price come back to previous start point of previous order so we will be winner like with news time or pairs fatly moving like gbp jpy

like this

Or like this with up direction

Martingale up reverse direction

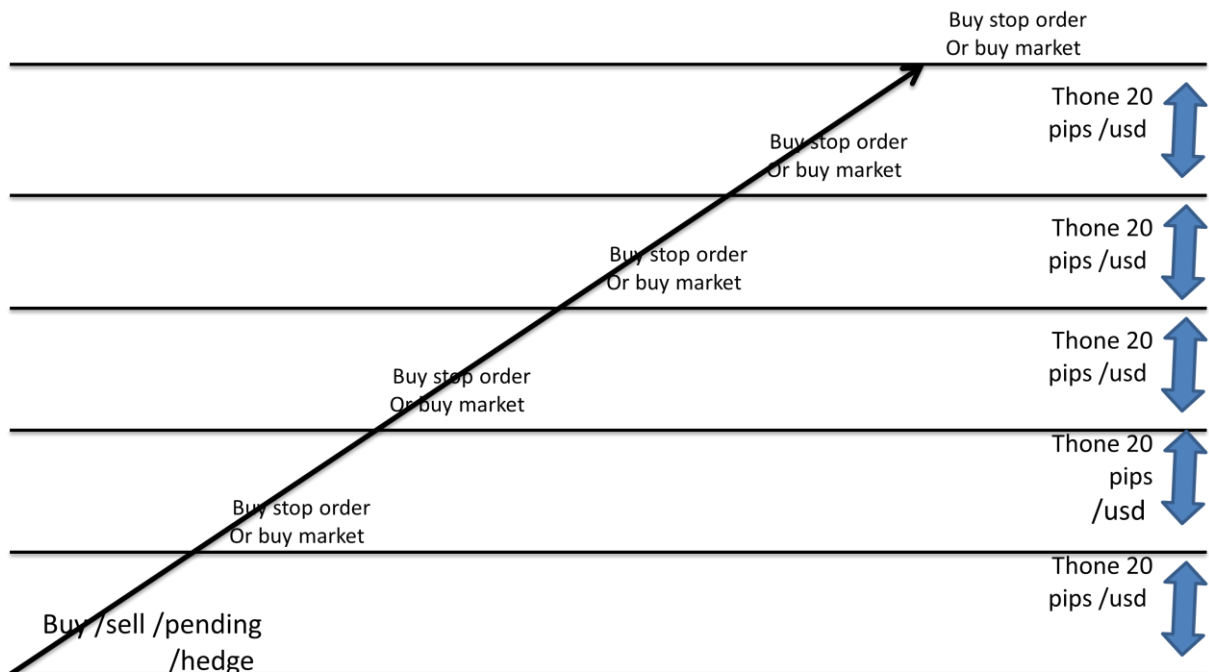

But this strategy have problem because if the price continue without correction or comeback at previous order we will open so much lots and we will get margin call

and we have also anti martingale

Is we will open order with direction and same first order type wined when we will wine first order it is aime to increase or wines

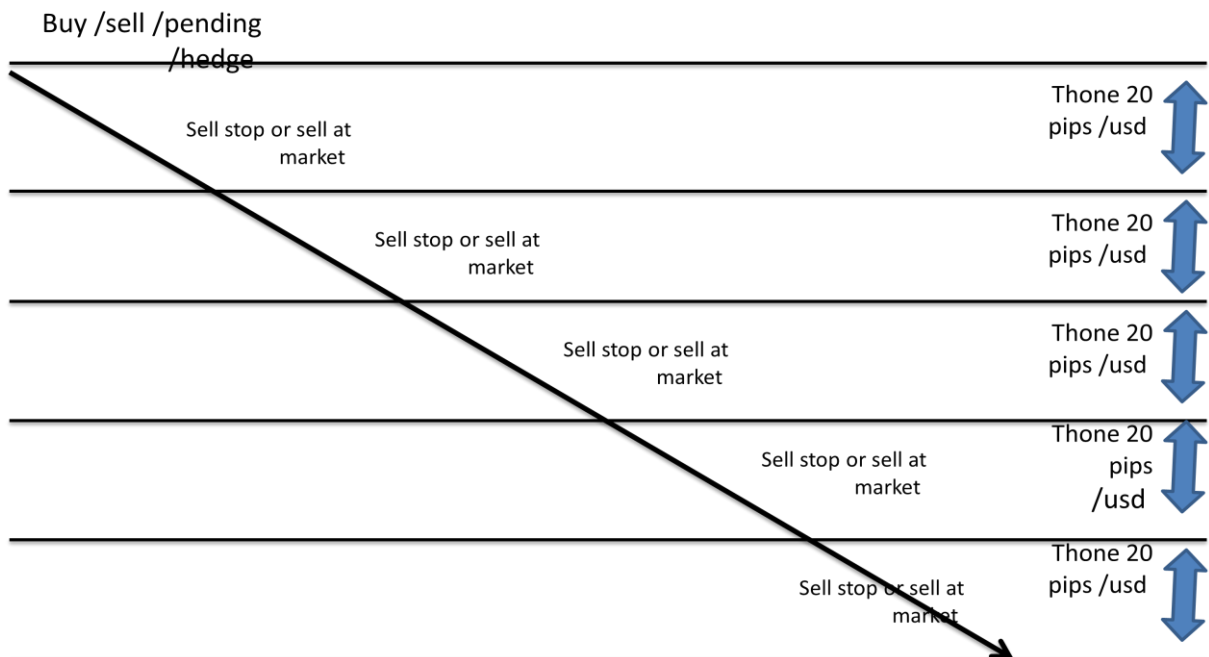

Like this

MATINGALE WITH DIRECTION UP DIRECTION

Or like this with down trend

MATINGALE WITH DIRECTION DOWN DIRECTION

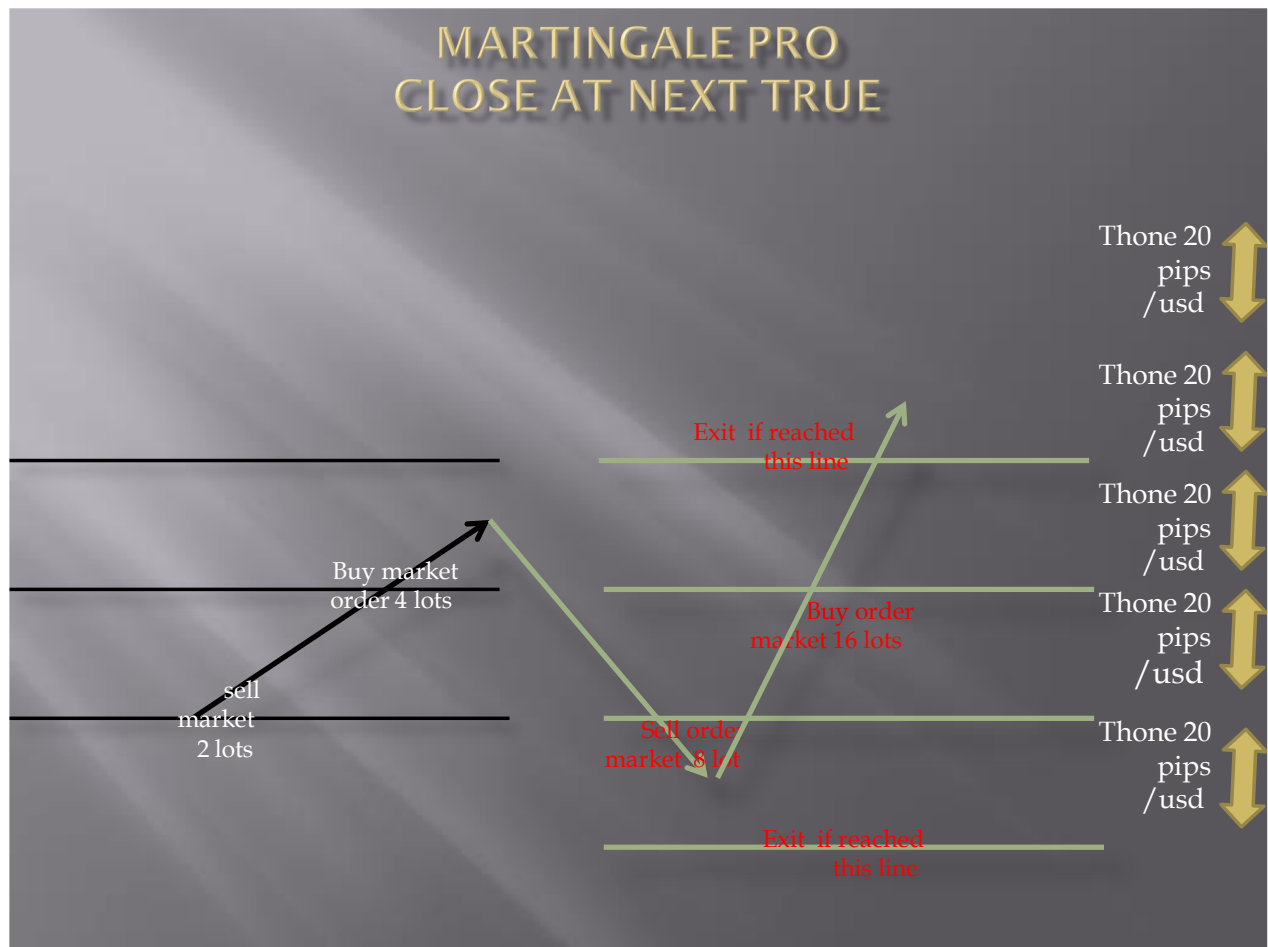

But this strategy have problem because when we will open next order should be multiply so if at final order the price make correction by our thone and comeback at previous order start point we will losses every what we wind already and more losses

So we wiil make complex martingale what can wine if the price continue in him trend and we will wine if the price comeback also

So the idea is start first order and select special point like exit point at profit or open next order opposite type if we will be at losses and we will continue even we will wine one final order

Like this

Inputs martingale market orders *

With inputs martingale pro it is same logic of systems of recovery thone it is first order at market or pending and or hedge and all next order will be market order the next order it is alleys opposite type of previous order

And we have thone it is step between previous start point of order and start point of next order

And we have exit order it is not looking just stop loses or take profit but many condition and many inputs we will talk about

1- Martingale pro : true /false

If is true we will use the system martingale pro and if it is false we will not use this system and the ea will not run it

But here if it is true should the eaa look other systems in the ea if true and should all work friendly toghather not one restrict working other and if we have commune inputs should respect it

2 - Type of direction :up /down /uo and down

Down

Here we have three options if with down direction the ea will open just orders at market with down direction when the price go more down after first order in lose like first order if is buy or hedge

up

And if we select up direction the ea will open orders buy and sell at market just when the price go more up after first order if is sell or hedge

Down /up

if we select down /up and will open first order and after depend where the price will go we will open orders opposite

and after the price finish one strategy we will open also with same input still one one pro martingale if continue trade is true

Notice very important

We use all time market order because we will up direction and down direction and open type order opposite with direction like buy with down trend and sell with up trend and sell with down trend and buy with up trend so we will be obligate to use all type of order limit and stop deoend condition if it is down or up trend and our next order will be with direction or opposite type direction so me be also will be obligate to make pending order and after delete if price take other side trend and much time we will not use our pending orders and we will be obligate to delete it and make ain new pending order so that will be very hard calculation and condition and at chart crazy and will be very hard and long for coding all condition so we prefer all time use order at market not pending

3-Max pips :.....1000 pips

If it is 0 that is mean false

But if

Here we selected any max pips that is mean we will open strategy pro martingale to have this pips from first orders even the price advanced this pips number and if it is reached this pips maximum we will not open more orders and the ea will look the exit obligation in other inputs specified for exits obligation and if

4- First order : buy /sell /pending

Buy

Here if we selected buy first order will open at market order and that will be buy market order

sell

If we select sell same that will be sell order at market execution

Pending

And if we selected pending the ea will look the first thone and that will dived by2 and will calculate after half the first thone pips in high will make tow limit order one sell and after in down from the price and the half pips of first thone in that point the ea make one limit or stop order opposite by same lot of first order and order opposite in opposite side here if first order opened here directly we will modify second order pending to have second order lots and wine at profit we will close all

For example if first thone is 100 pips after first order or after 100 dollars losed after first order opened

so the ea make one pending stop order higher from the price 50 pips or dollars buy stop and in down the price after 50 pips or dollars one stop order sell order

Here after open one of the both pending order we delet the other orders but here the next order should take number order like second order and should not consider the pending order deleted like second orders because in the coding the ea will have problem to calculate his number of orders when that need for other inputs need the ea work with number of orders for example with lots and thone and take profitsetc

So first order can be sell or buy but all time in pending start type is stop order our tow first order so the martingale mean like everyone now if first order not go to profit open opposite order in our system it is mean we can open more stop order with or opposite with direction not like first order

Type

5- Close at next :true /false

that is mean if we open next order we will close previous position so every time we will have one position open in the market

and if it is false that is mean don't close previous positions and keep all positions opened even the ea close all positions of this strategy by other inputs of closing Close reversing number order ... 7.....

or Close first previous orders

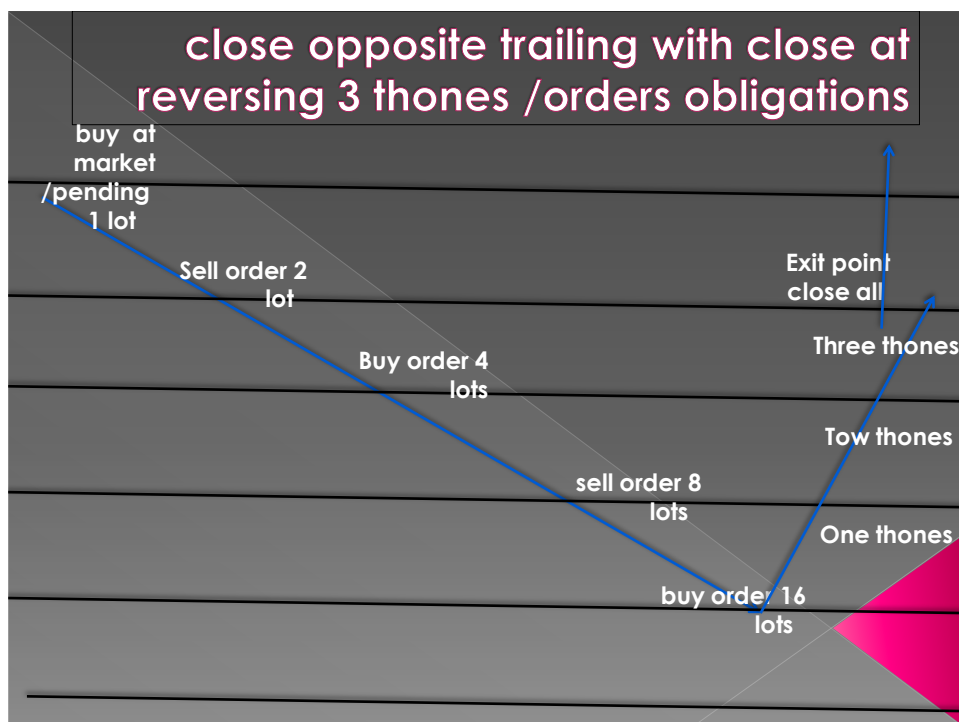

or

or

..... etc

6- Close at reversing number order ... 7..... for example if the price opened 27positions at up tend and last order it was sell and the price comeback at start point of position number 20 so in this time close all order and positions opened in this strategy at reversing 7 order but here just working this input if we will close at reversing so at final orer is opposite with type of trend so at correction of price

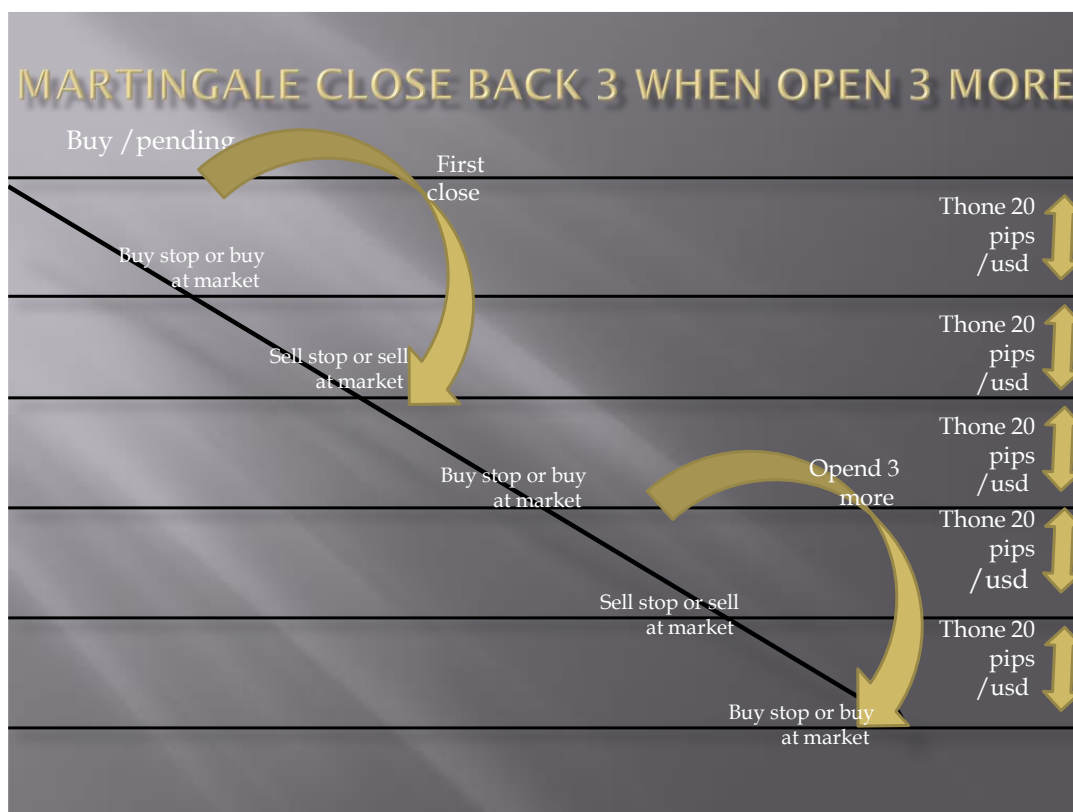

And if we select 0 that is mean don't use this obligation and look other obligation to close all order or any order

7- Close first previous orders3at progress every next3..... orders

Here if we select 3 order and when we progressed and opened every 3 more orders we will close 3 first order in back side but here we don't look if we close loosed order or wind but here we close looser and winner

And if we select 0 that is mean the ea don't use this obligation for close any order

8- Close first previous loosed orders3at progress every next3..... orders

Here if we select 3 order and when we progressed and opened every 3 more orders we will close 3 first order in back side wind but here we close just loser pervious orders opened and we keep other s 3 winner open like opposite of the 3 loosed

9- Close first previous winner orders3at reversing at3..... final orders

Here if we select 3 order and when we progressed and opened much order when we have 3 winner in back we will close 3 first order in back side but here we don't close loosed order but here we close just winner pervious orders opened and we keep other s 3 loser opened like opposite of the 3 winner

10- Close all winner after order15

Here if we select after 15 order and when we progressed and opened 15 order when we have here we close all previous winner order even order 15 and keep just loser order

11- Close all loser after order15

Here if we select after 15 order and when we progressed and opened 15 order when we have here we close all previous loser order even order 15 and keep just winner order

Flter side way it is more important inputs

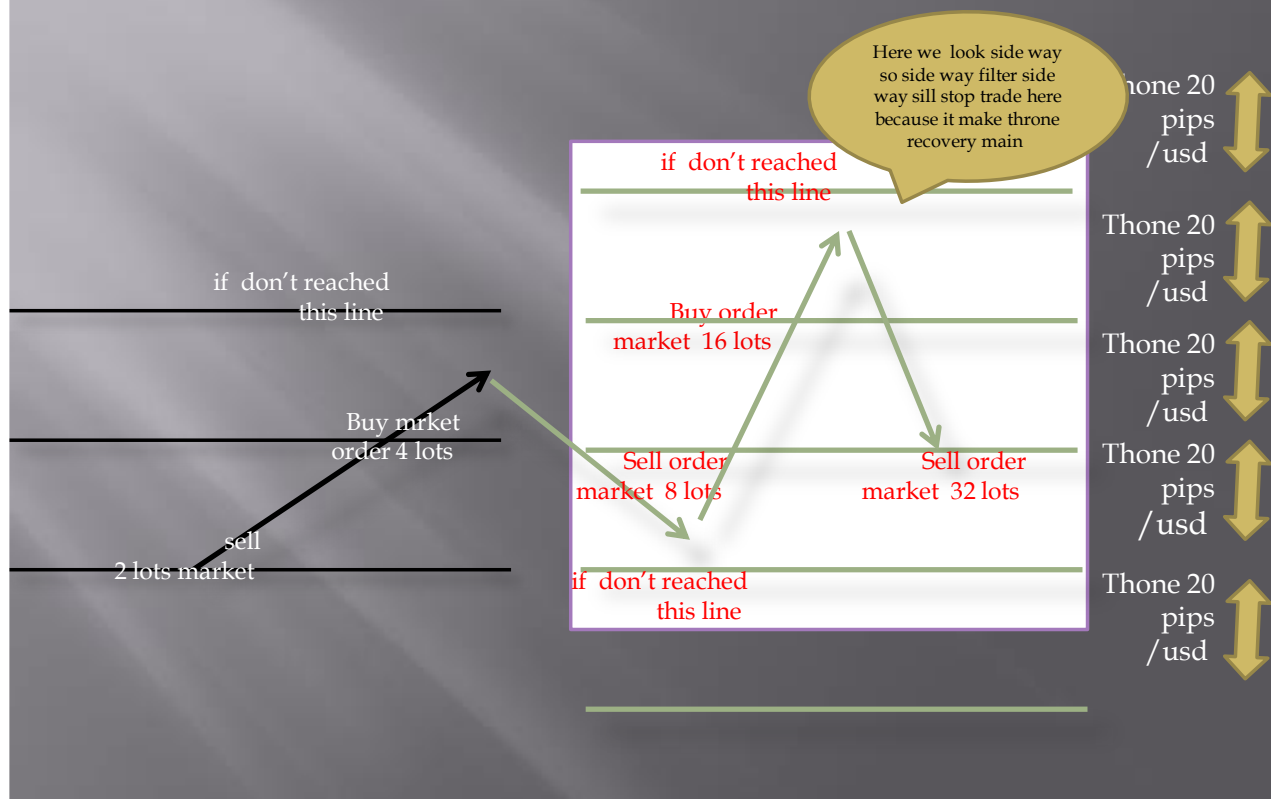

Because it let us don't have much order when the price go side way because pro martingale wine when the price go down or up

But when the filter side will work that

Will work when the price will open much order between tow thone line and don't reach higher and lesser this level so that will make like system main then recovery (read thone recovery main system and side way filter files)

Condition of start filter side way in pro martingale

MARTINGALE PRO CLOSE AT NEXT TRUE WITH FILTER SIDE WAY CONDITION

Thones : Fixed pips / Multi pips / Fixed money/ Multi money

So if the thone it is mean step between previous order and next order

So if first order opened and we go with high trend so after the price gopips or money (not important if it is loser or profit that depend which is first order but look to open opposite order) so we open next stop or market order

so here we have four options

fixed or multi pips for that: we use market or pending order to build the thone and open next order

and if it is fixed money or multi money we will use execution at market

so if it is fixed money or fixed pips we will write just first thone and the ea will consider that for all next order

and if we select multi pips or multi money should to have 40 inputs to write manually all 40 thone between all pervious and next orders

Filter time :true /false it is popular inputs

Start hour :

End hour :

If false we don't restrict the strategy with any time to close or open

And if true

We select start time and stop at time but stopdirectly the ea will continue him procedure eveny finish but if not next strategy arrive the time of start time will not open again and juste it wiil wait to tim start happening and it the ea will look the time of the platform

And we need also select

days trade

All days off week :

Sunday: true/ false

Monday: true/false

thusday: true/false

Thursday: true/false

Friday : true/false

Wednesday: true/false

Continue trade :true false

if true we restart the strategy when we close all sposition

Should

Filter time look other entry input also like start at price and filter time if they are true

And if it is false we don't restart again the strategy any more time

Start at price if we select any price should the ea wait even the price arrive this point and start the strategy in this point and should look also other entry input if they are trye like filter time and strat type and first order type and if it is 0 that is mean it is false

Max order if we select any number of order here the ea will stop to open more order after opening that number of orders and here we will look at other exit inputs to know where we will end the strateg like take profit and close at next and close at profit and stop lose ...etc

Win dollars after orders5th order number for example

Win dollars10.....dollars if currency of the balance is dollars

So when we reach in total profit between all loser and profit this amount after order number 5 we will close all orders an positions here should the ea look juste the equity if close at next false and equity and balance if close at next true

Close at lose percent10.....100/10 after order5th

So if we will win 10/100 after order number 5 th we will close all position and all orders

Here also should the ea look juste the equity if close at next false and equity and balance if close at next true

Close at lose percent10.....100/10 after order5th

So if we will lose 10/100 after order number 5 th we will close all position and all orders

Here also should the ea look just the equity if close at next false and equity and balance if close at next true

Break event after order6.....ex

It is mean when the wine will be equal our losses considered spread and commission include the ea will close all order after order number selected

Lots inputs

We have many system or atomically calculations to know next lot needed by the expert

We just need write first lot

And after chose which calculation system

And we have five systems

start auto lots

multiple

plus

Minus

Davison

Uniform system

And after we will but the value of calculation

Value for example 2

If multiple 1like first order multiple 2like value that will be 2that is mean the second lots it is 2 after the third second to know we will multiple second lot with the value $2 \times 2 = 4$

If system plus

We will do previous lot with the value we chose like $1 + 2 = 3$

After $3 + 2 = 5$ Etc

If minus

Previous lot minus the value

For example first lot we choose 10 lots and value 1 that is mean $10 - 1 = 9$ second lot and $9 - 1 = 8$ third lot..... Etc

And division that what the new I want

It is if first lot it is 10lots and the value it is 1that is mean the second lot is $10 \div 2 = 5$ second lot and third lots it is $5 \div 2 = 2.50$

Uniform system that is mean

If we chosen first lot 5lots that is mean this every next lots will be same

System manual : should we have be able for system Writing 40 different lots

Lot1.....

Lot2.....

Lot3.....

Lot4.....

Lot 5.....

Lot 6.....

Lot 7.....

Lot 8.....

Lot 9.....

..... Etc lot 40.....

Auto lots : true /false

If true

Number of lots : 1 lots ex

Every :10000 dollar in balance ex

And auto lots it is one of money management

It is looking our balance when

We will increase our first lot every specific amount

For example if we look our balance if we have every 10000 dollar we will start first order by 2

And if we will in future have 20000 dollar we will start by 3 lot

Notice Very important auto lots system don't work if we select manual lots system

Take profit inputs

We have four systems for take profit

Every system work with writing to 40 different take profits

And we chose that's numbers what is mean if we are put

1tp10

2tp..... 15

3tp..... 20

4tp.....30

5tp.....40

If we chose money that is mean every numbers it is mean money any and we have two systems of money we have fixed the money and multi money

If we chosen fixed money that is mean the expert will take first take profit we write like take profit Common among for all next order

And if we chose multi money we will be able to write 40 different among by dollar

And the expert it will take every take profit one by one Sequentially

And we have second system that is by system take profit pips

And we have tow system take profit by pips

The first if we writhed

1tp10

2tp..... 15

3tp..... 20

4tp.....30

5tp.....40

And if we chosen fixed pips that is mean the expert Will take the first take profite by pips like take profit for all next order in our strategy transaction but here by pips

And if we chose multi pips that is mean if we chose take profit system multi pips the expert will take all take profits we wired one by one sequentially like different take profit we have for every next order

Stop lose inputs

We have four systems for take profit

Tow system automatically and

Tow system work with writing to 40 different take profits

And we chose that's numbers what is mean if we are put

1th stop lose10

2th stop lose 15

3th stop lose 20

4th stop lose30

5th stop lose40

And if we chose money that is mean every numbers it is mean money any and we have tow systems of money we have fixed the money and multi money

If we chose fixed money that is mean the expert will take first take profit we write like take profit Common among for all next order

And if we chose multi money we will be able to write 40 different among by dollar

And the expert it will take every stop lose one by one Sequentially

And we have second system that is by system stop lose pips

And we have tow system stop lose by pips

The first if we wrote

1th stop lose10

2th stop lose 15

3th stop lose 20

4th stop lose30

5th stop lose40

And we chose fixed pips that is mean the expert Will take the first stop lose by pips like stop lose for all next order in our strategy transaction but here by pips

And if we chose multi pips that is mean if we chose system multi pips the expert will take all stop lose we wired one by one sequentially like different take profit we have for every next order

Tailing stop and trailing step

Same situation for trailing step and stop of main system and reverse

And same think for trailing stop and trailing step but here we have just tow option fixed pips and multi pips

And fixed money trailing stop and multi money trailing step

And with 40 inputs to write 40 different trailing stop and 40 inputs to write 40 different trailing step by money and pips
