

# 1 Introduction

---

Good day can you please design for me an indicator that will work on MT4 and MT5 .

The indicator will work on the on any timeframe but the **the 1HR timeframe** is suitable and all of this are based on certain condition.

The indicator will basically draw two different type on of horizontal lines based on a certain price increment.

\*The first horizontal line will start from 0 with an increment of 100

\*The second Horizontal line will start from 50 with an increment 100

Example of the first horizontal lines. Starting from zero with an increment of 100

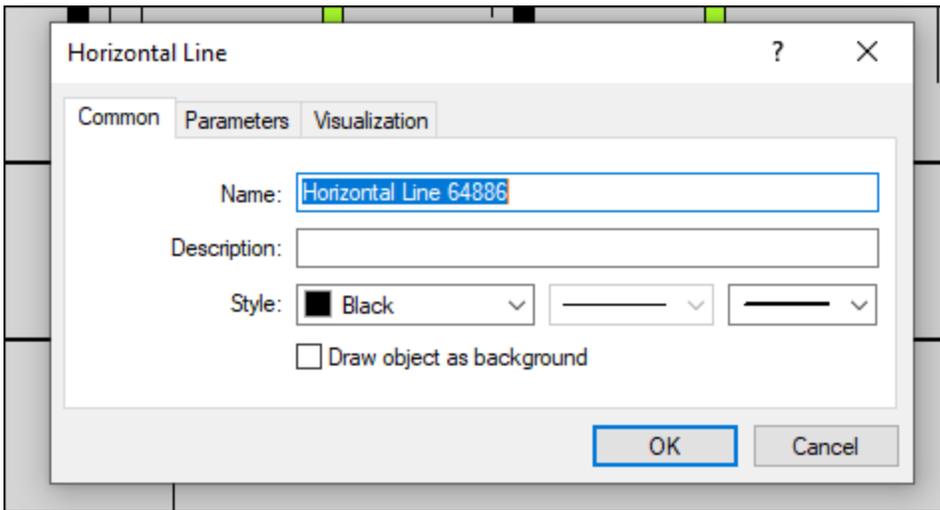

---

The indicator has to draw horizontal lines on numbers with interval of 100. Starting from Zero

Example: The price will start with 100, then the next horizontal line will be 200, then 300, 400,500, etc....

The user must be able to customize the color, size of the lines and must also be able to choose if those line will be dotted lines or solid lines as well.

Below is another example on how this horizontal line should be displayed

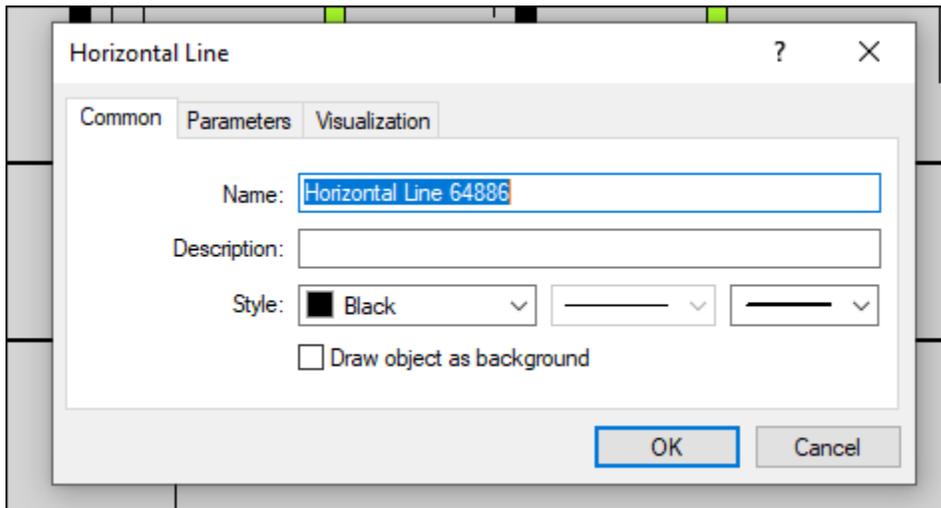

Example of the first horizontal lines. Starting from 50 with an increment of 100

---

The indicator has to draw horizontal on numbers with interval of 100.

Example: The price will start with 50, then the next horizontal line will be 150, then 250, 350,450, etc....

The user must be able to customize the color, size of the lines and must also be able to choose if those line will be dotted lines or solid lines as well.

Below is another example on how this horizontal line should be displayed

## Putting all together

Basically, this how the chart should look when the two horizontal lines are draw the price on the chart.

The user must be able to customize the different horizontal lines differently
