

## MT5 ATR Volatility Indicator

Indicator based on ATR that constantly scans unusual volatility/fast movements in **real time** for MT5 especially on **synthetic indices (VIX and JUMP)** and then send an alert when volatility is at its highest. The indicator should show text box on chart.

I would prefer for the indicator to show on **one** chart all the data/alerts from all selected indices and this is to simplify installing on individual charts and having many charts on the screen.

### Example below

1. The alert message should disappear as soon as the volatility is back to normal and stay as long as the volatility is going on.
2. Volatility alerts should be in real time and not delayed
3. Indicator should paint the volatile candle on different time frames especially the 1min, 5min and 15min for tracking purposes.
4. An option to choose which indices the indicator should scan for alerts must be included.
5. Indicator should not have false alerts.
