

Update an indicator:

A dev coded a custom indicator and an EA for me. I need to add them some modifications.

The indicator is a multi-timeframe / symbol scanner that provides signals based MA crosses and price action. The EA is a manual trading tool that help me in manage the trade.

Here you can download an old version of my indicator (full of bugs and not working.. this is the 1st prototype i get from the dev, but you can see he's code's styling).
https://www.dropbox.com/s/zs1xdece7prof61/Multi_Timeframe_MAs_Alert_Indicator.mq4?dl=1

I'll need to speak with you by voice to accelerate your learning curve. At the end of the job you'll get an amazing indicator for free: it's a sort of bonus because it's working very well and i'll be happy to let you understand exactly how to make money from it. These will be the modification I need: all will became clearer when i'll explain everything to you and we'll start coding together. For every single points i'll explain to you how the indicator worked in past and how it will have to work after your help; you'll just find the related code section and modify (or add code to) it. Just have a look at the following points not to really understand what's the specific request but to see if these are stuff you're able to handle this kind of things. Thank you.

I need a very good dev to start a solid professional relationship. Please, consider I'm very tired to work with

devs that are not of their words: be sure about your delivery time or i'll have to invest my money to give a real and proofed negative feedback. But if we'll agree about money and delivery time and you'll do all you can do to stay in these parameters, and i see you're really commatted on my project, then i'll leave the best feedback ever to you and purchase again, again and again :)

PS: FINAL SOURCE CODE REQUIRED

INDICATOR:

A) The original version i provide scans the market (in multi timeframe and multi symbol) for specific MAs crosses and back-crosses. Now i need to let it send signal when candle wings touch a specific MA

H) Armed Alert button on chart - same function of MT4 Auto Trading enable / disable button for EA (enable/disable alerts based on inputs setting). - this feature is completely new but no object coding needed: you can just copy already existing buttons i can provide the code.

I) MultiTimeframe/Symbol scan ON/OFF (default = OFF)

in inputs tab - this feature is completely new: originally the indicator worked in MultiTimeframe/Symbol mode by default. This feature let me use the indicator “on the fly” on a single symbol/timeframe without hassle about other symbols or timeframes alerts

J) ATR setting have to be hidden in Inputs tab (use fixed 1D / 7 values) - originally ATR parameters were displayed in the inputs tab

K) Drop-down menu in inputs about how long the candle was to open before to trigger the alert: Send the alert only at 1/2, 2/3 or 3/4 of the candle time has passed (for example, if i set 3/4, H1 candle will trigger the signal only when 45 minutes will be passed after it opens) - this feature is completely new

L) Enable also M1 timeframe (littlest Spread Vs ATR will works for $TF \leq 15M$) - originally signals were sent only from 5M+ timeframe

M) disable timeframes (input field where i can place TF to disable such as: 5M,15M,30M) - this feature is completely new

N) Big message label in the chart: CAUTION: THIS CHART SEND ALERTS FOR POTENTIAL TRADES! (input text field to modify) - this feature is completely new, it does not show anything on the chart but MAs and arrows from signals

O) new default labels and values (i'll send all of them when we're going to finish)

P) Alert text messages (i'll write for you when we're going to finish)

Q) It could be i'll find some fixed setting that have not to be changed anymore when using the indicator in future: i probably ask to finally remove them from the inputs tab

at the end of the job

Little further fixes if needed (sometime it's possible to discover little changes while working on a project: anyway minor stuff, not major changes will be required).

EA:

X) Auto Magic Number based on yy:dd:hh:mm:ss:

RANDOM NUMBER FROM 0 TO 99 + 10:39:17

22103917

78103917

Y) When a button is clicked, then the EA is in “armed mode”, waiting for an event triggering the trading activity. I need “Armed color” for clicked SL button (change button color when BUY SL or SELL SL has been clicked and EA is waiting to open the trade at the next candle). Add new colors for BUY and SELL SL armed buttons in inputs tab.- **this feature is completely new: EA didn't display that it was in “armed” mode on the chart.**

Z) Delete the Remove All Lines button: when i click SELL BUY at the first time it places the line and armes the EA; at the second click it delete the BUY SL line and disarms the EA - **this feature is completely new: originally EA had a button to remove lines; now i want the same feature triggered by another button that already has other functions.**

AA) TRADE / PAUSE control where the Remove All Lines button was: “TRADE” (green button) and

“PAUSE” (yellow button). It will let me put the EA in standby. By default the button is in the TRADE mode when the EA is loaded, showing the green TRADE button; when clicked, it will show the PAUSE yellow button and EA will not open any trade or send any signal at all since i'll set it again in TRADE mode) - **this feature is completely new but no object coding needed: you can just copy already existing buttons i can provide the code.**

AB) When MAs cross back (based on using Closing MA or Normal MA Closing options), then send an alert and automatically switch in pause mode (both, if the trade has yet started or not) - **this feature is completely new**

AC) Trailing stop behavior (we'll discuss it)

AD) Take into consideration the current spread when calculate the lot size (i place manually SL some pips above a given level to take into consideration the Ask line) - **this feature is completely new: originally EA calculated size without looking at the spread (as the ask and the bid line were at the same level)**

AE) Lot Size: in chart, use a better visual text size and text position, aligned with the size text field - **this feature is completely new: just fix the style**

Fixed lot size default option

AF) new default labels and values (i'll send all of them when we're going to finish)

AG) Alert text messages (i'll write for you when we're

going to finish)

AH) It could be i'll find some fixed setting that have not to be changed anymore when using the EA in future: i probably ask to finally remove them from the inputs tab at the end of the job

Little further fixes if needed (sometime it's possible to discover little changes while working on a project: anyway minor stuff, not major changes will be required).

Indicator needs one more simple feature:

- AI) Below the "TRADE / PAUSE button" (see the EA requirement above), Indicator has to show the following lines: ATR in pips, Today's Range in pips, Spread in pips (< 3 text in green, 3= \leq pip < 5 text in orange, \geq 5 text in red), ATR vs Spread in % (< 5% text in green, 5= \leq % < 7 text in orange, \geq 7% text in red), minimum triggered timeframe for current symbol, candle time to close - **this feature is completely new, it does not show anything on the chart but MAs and arrows from signals**
