The indicator is based on the concept of Open Books and ICT concepts.

What are "Open Books":

What are "OPEN BOOKS"?

We use the **5 minute time frame** to draw the open books, if possible I like to see the 5M open book *lines* also on M1 chart.

We only focus on BEAR candles:

- For a bullish line, the line is drawn as soon as the bear candle has a bull candle that closes above the body high of the bear. The line will disappear as soon as there is a close below the line. Line is drawn at the body-high (= open of the candle), color: Blue

- For a bearish line, the indicator will wait for a bearish candle to appear after a bull candle. And then another bear candle to print (because there's no point drawing it if the next candle becomes a bull anyway). If theres another bear that closes, it will draw the line immediately upon close (line is drawn at the body-low (= close of the candle). And will disappear if there is a close above. Color: red.
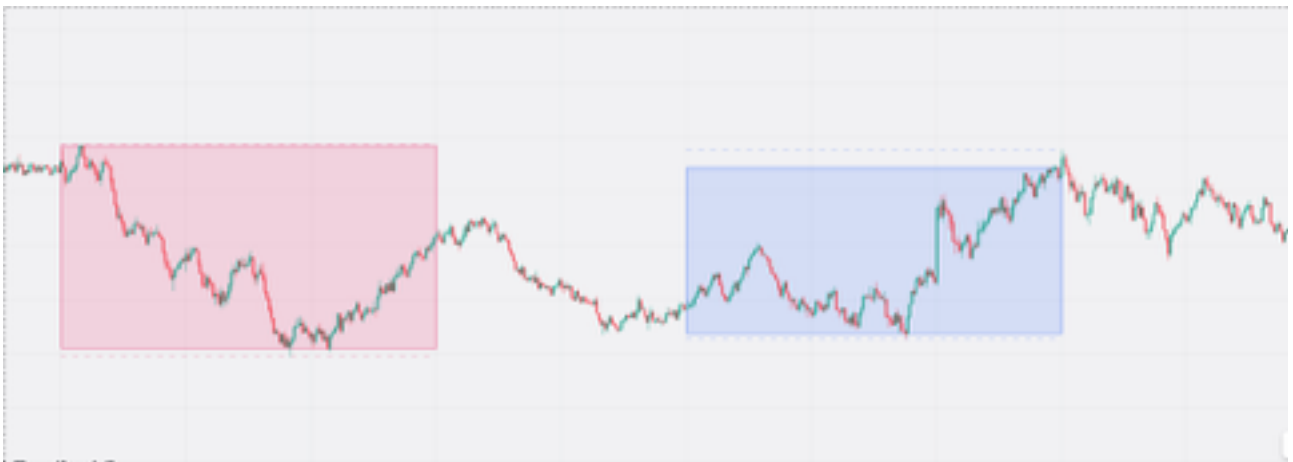

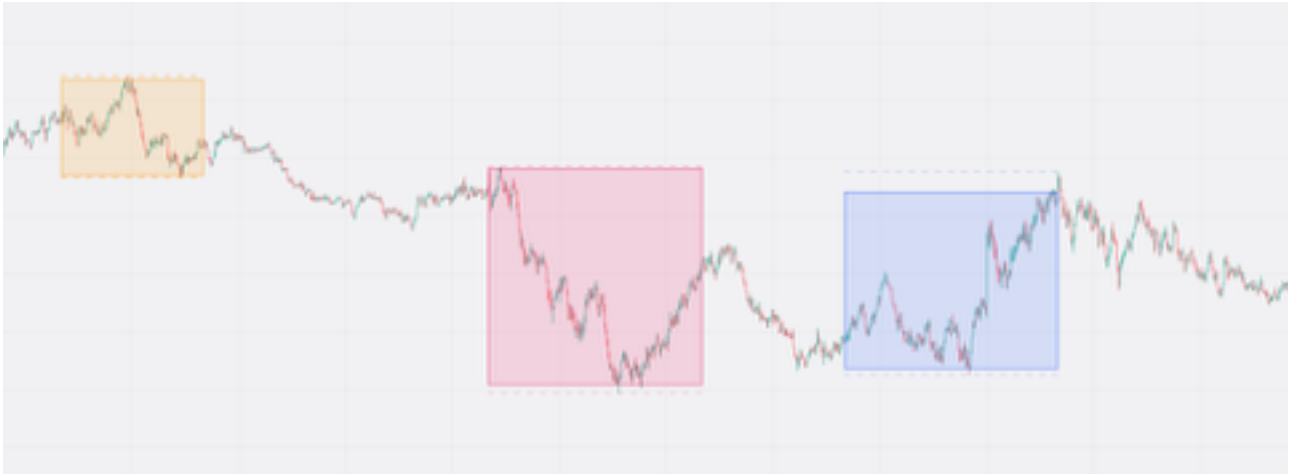

EXAMPLE:

The indicator must plot:

1. Current day Open Books => line thickness 1

2. All untouched Older Open Books (last 10 trading days) => line thickness 2

3. When the NY session opens at 7am, the indicator plots a horizontal line with label "HIGH" or "LOW" (label visible at the right of the chart) at the highest body close candle or lowest body close candle in the time period 5pm until 6:59 am.

4. From the start of the day (5pm) The indicator must also plot today's Kill Zone Sessions, 3 custom colors, like this example:

==> Rectangle for session body high/low
==> dash line for session wick high/low

What else must the indicator do

Alert function 1: (option to turn alert on/off)

The indicator must send a pop up alert with sound + push notification when these 2 conditions are met:

1. Only alert when we are in NY Kill Zone Time (7am-10am UTC-4), adaptable for any broker time
2. Price comes within a xx pip distance (custom) from the "high or low line as explained in point 3 on page 1 (once per minute).

Alert function 2: (option to turn alert on/off)

The indicator must send a pop up alert with sound + push notification when these 2 conditions are met:

1. Only alert when we are in NY Kill Zone Time (7am-10am UTC-4), adaptable for any broker time
2. Price crosses (body or wick) the "high or low line as explained in point 3 on page 1 (once per minute).
