Oil Spot Strategy in Forex

Is an idea has been developed into a theory, has been called:

Oil Spot Strategy in Forex

When the oil spot spread over a wide area of flat ground
And whenever there is any gap in the oil spot
Find aspects of the gap; accelerate to fill the void in the gap

This is exactly what is happening in the oil spot strategy in forex

Where pending orders are placed, buying and selling in a series of orders
And whenever the price moves for hours and days
You will find a number of pending orders, have been activated

There you will find winning orders and losing orders
Just close winning orders and keeps losing orders
Until changes the position of the price and makes from losing orders to winning orders
And activating new pending orders

In practice

For example,

Let's take GBP/USD to put the following pending orders, when the price is 1.5550:

Buy

1.6020/1.5920/1.5820/1.5720/1.5620/1.5520/1.5420/1.5320/1.5220/1.5120/1.5020

Sell

1.5990/1.5890/1.5790/1.5690/1.5590/1.5490/1.5390/1.5290/1.5190/1.5090/1.4990

When the price moves for days and activates a number of pending orders

Then close only winning orders like:

1.5590 With 1.5520 to have 70 pips

Or 1.5490 with 1.5420

Or 1.5690 with 1.5620

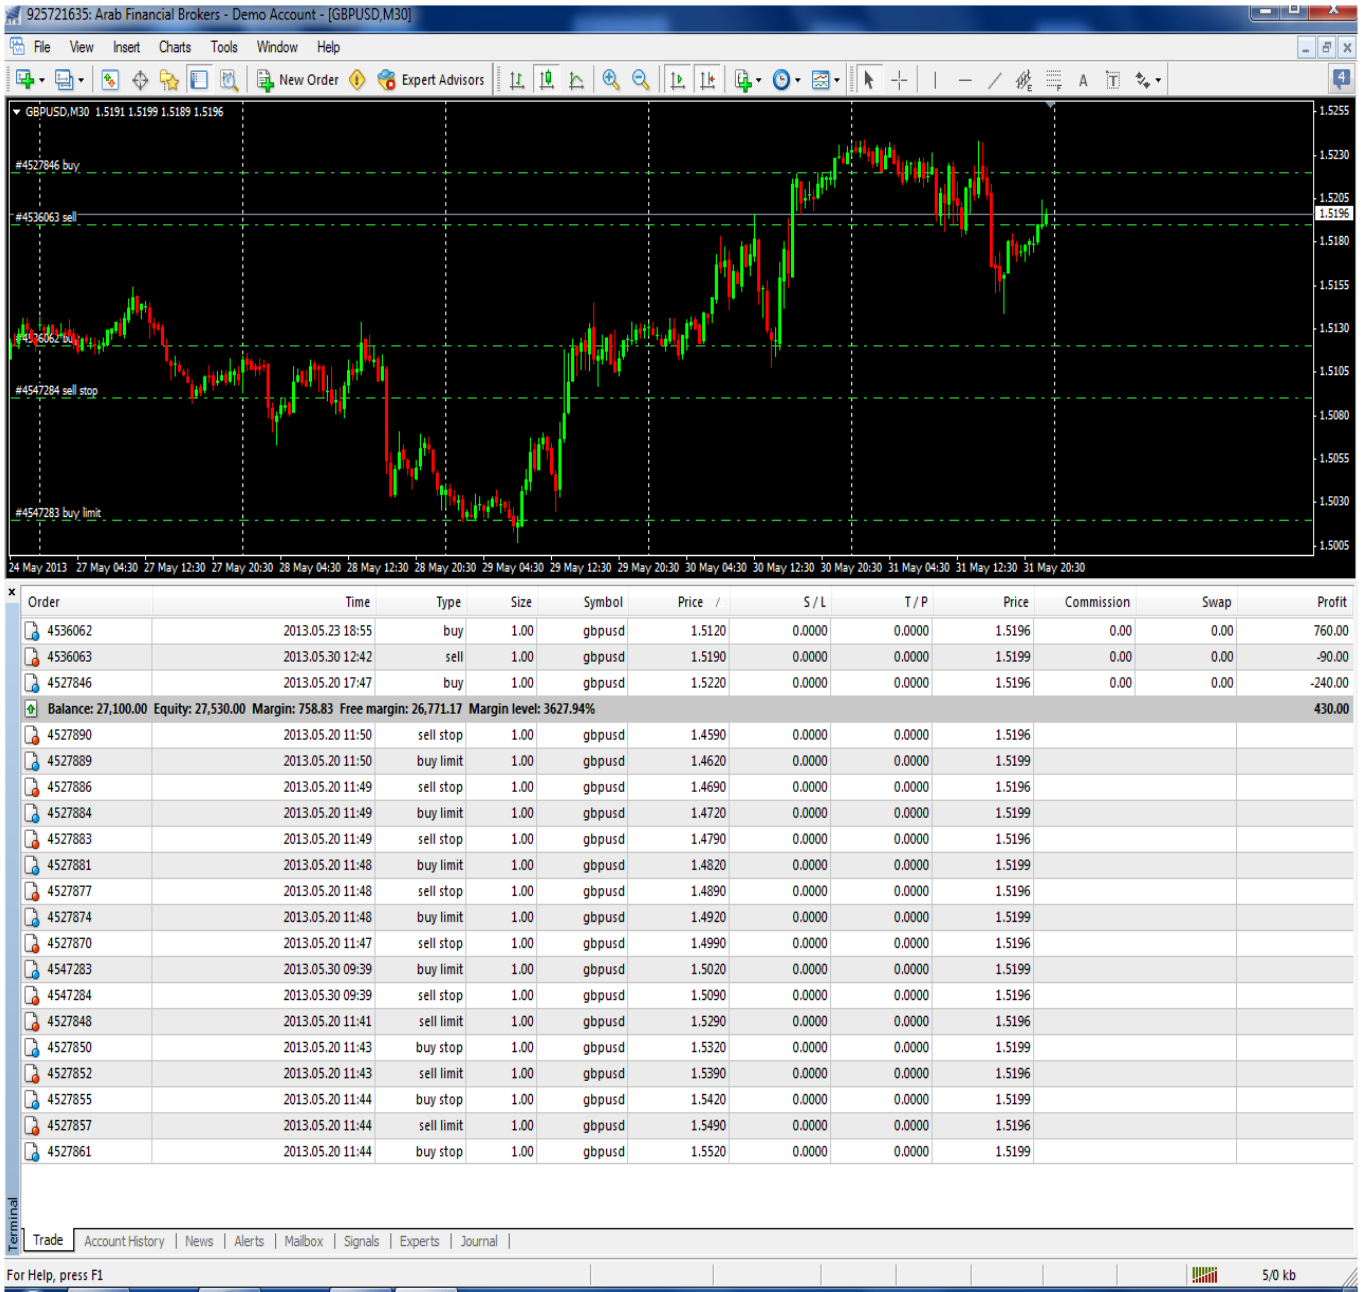

And keep losing orders until the price moves and makes from losing orders to winning orders

Don't forget to put new pending orders instead of winning orders which were closed at a profit

This is characteristic of this strategy as a zero-loss strategy

Example,

In this photo, notice how the pending orders are put:

In this photo, notice how the winning orders are close:
