After Purchase

Thank you for your decision to buy my product!

Right after you purchase the system, simply activate it on your Metatrader 4 or 5 platform, depending on what version you bought.

To do that, you first need to log in to your mql5 account on the Metatrader platform. After doing that, navigate to «Market» in the terminal window. Now you should see a tab saying «Purchased». Navigate to that window and download the EA.

On the left-hand side of your window, you will find the «Navigator» panel, where you can see your Account, Indicators and Expert Advisors. All of which are dropdown menus.

The downloaded Dax Breakout System is listed under the «Market» in the «Expert Advisors» dropdown list.

Settings

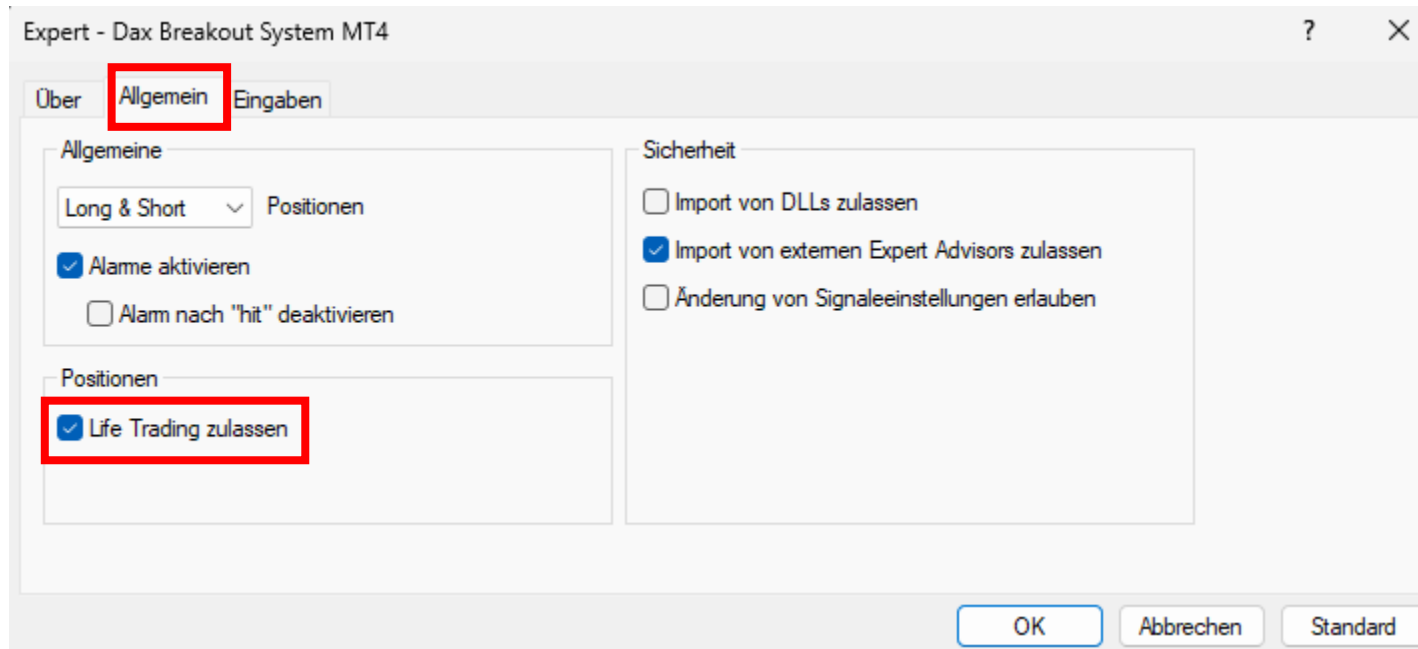

After downloading the EA, allow the terminal to execute trades automatically.

Now simply drag and drop the EA on your DAX M1 Chart.

A window will pop up with all the different settings.

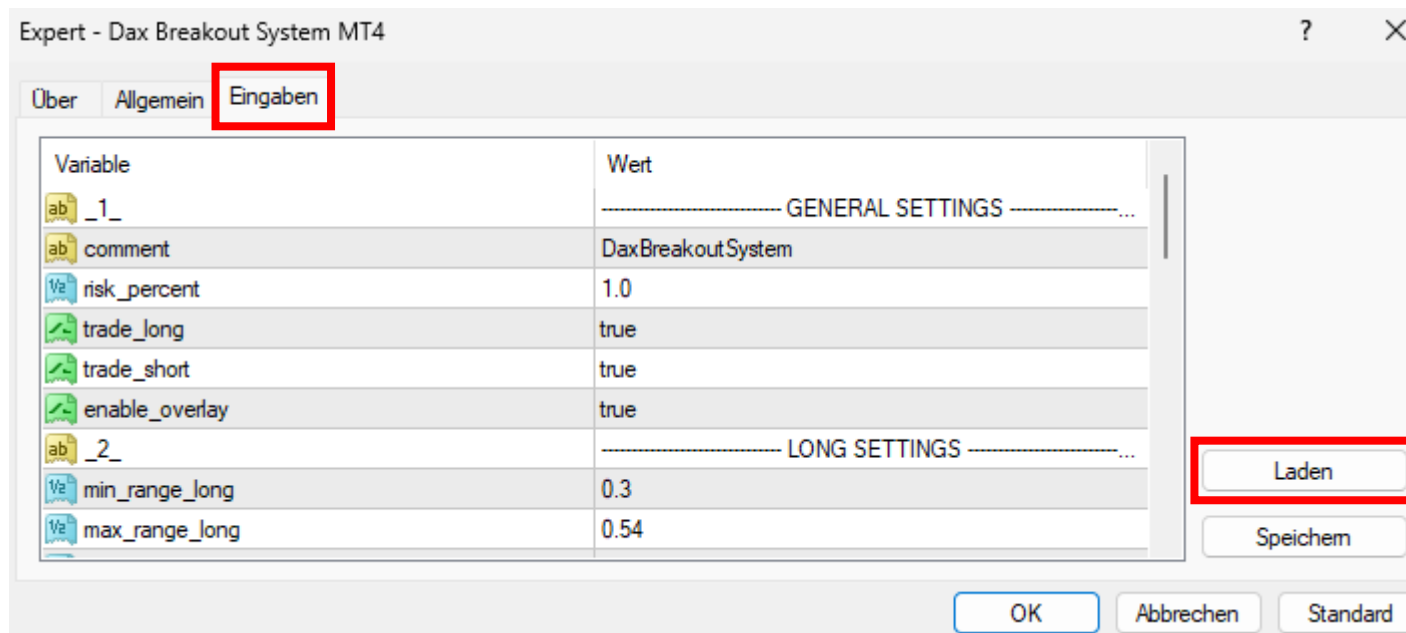

In the «General» tab, make sure to check the box «allow live trading», if it's not already checked.

To make your work easier, I provide presets, ready to be downloaded.

You can find them in the Expert Advisor's description on mql5. To load the setfiles, click the button «Load».

You can now browse in windows explorer and double click on the setfile you'd like.

Backtesting

The DAX Breakout System operates on GMT +0. To perform your own backtesting, you need to download tick-data based on GMT+0.

After doing that, you will be able to do your own backtesting and optimization.

General Information

The volume calculation works with the distance to the Stop Loss. Depending on how much risk you want to take, the volume increases or decreases, but the distance to the Stop Loss remains unchanged. This could lead to problems with lower-funded accounts. When the Lot-step your broker provides is 1, I recommend using a higher funded account. 100'000.- would be optimal, so the calculations don't affect the performance.

As an example, you have 10'000.- loaded into your account and the distance to the Stop Loss is 200 points. That would be a loss of 2% with a Lot size of 1. The EA then can't trade a lower Lot than 1, so it takes 1 for the trade. This could have effect on the performance of the EA in either way.

If the Symbols lot-step is 0.1 I recommend an account with a balance of 10'000, if it's 0.01 1'000.-

Backtesting was done with an account size of 100'000.-

The Setfiles provided are based on past performances and do not guarantee future results. I will not take responsibility for any losses.
