

Important Notes for Crypto (BTCUSD – ETHUSD):

1- Starting from **HFT AI V10.1**, it can also trade **BTC and ETH**, **BUT:**

- **The broker must not charge commission.** You must first check if your broker applies commission on crypto trading.
- **HFT can overcome a high spread and trade crypto even without the spread filter.** **However, this is important:** if your broker charges commission on crypto, those commissions will eat up the profits. Please make sure you understand this before trading.

One broker that does **not** charge commission on crypto is **IC Markets – RAW Account**, but there are others. Always check first! Use on DEMO first!

For **Gold (XAUUSD)**, commissions are acceptable since they are not as excessive as those charged on crypto when the broker works with commissions.

2- The presets provided for **BTCUSD** and **ETHUSD** are the starting point. In these, the **safety SL is set to 1 or 2% of the account** and the **Recovery parameter is enabled by default**.

Please note the suggested lot sizes: (fixed)

- For **BTCUSD** → 0.1 lots per every 1,000 in the account on weekend
→ 0.05 lots per every 1000 in the account from M-F
- For **ETHUSD** → 0.2 lots per every 1,000 in the account.
→ 0.1 lots per every 1000 in the account from M-F

Depending on your trading style, you may adjust settings such as expanding the trailing, increasing TP, or reducing the Recovery parameter. Please refer to the guide to check what each parameter does and how the changes you make will affect performance.
