

# **ACB Breakout Arrows**

This optimization has been carried out using a specific trading strategy based on the “ACB Breakout Indicator”.

It doesn't necessarily mean that the set of inputs provided in this PDF are best amongst all. You can experiment with your inputs and findings.

If you are using our indicator with your own trading strategy or you are not aware of the concept of optimization then you don't need to follow the recommended settings at all. Default settings are more than good for most of the traders.

## **Trading Strategy:**

- Open a trade on a new Arrow, the trade's entry should be at or very near to the Entry Level.
- Breakeven: Move SL to the trade's entry level when the price reaches to the Quick Profit line.
- After the trade is locked in breakeven, you can either close the trade at First Target or leave it running to achieve the Final Target or more.

## **Points to remember:**

- Use our indicator “[ACB Trade Filter](#)” to filter out the trades that are against the Trend and Market sentiment. (Available for free)
- Look for the major Support and Resistance levels before entering into a trade. If there is Sup/Res level available between the entry and First Target, avoid the trade.
- Look for major news announcements: Don't trade before and after 30 mins of a major news.
- Close all the trades on Friday before the market close.

**Optimized input parameters using "First Target" as a reference point.**

PAIR	TF	Signal Sensitivity	Bars for SL
AUDNZD	H4	8	4
CADJPY	H4	16	10
