

MaxiFinishTrend 2. USER MANUAL

Forex MT4 indicator

Author: Stsiapan Kreidzich (step_bot@mail.ru).

Very important warning!

The original indicator file is uploaded by the author only to <https://www.mql5.com> and stored there encrypted. **Buy and download only on this site through the links below for correct signals.**

If on other sites offer you this indicator, so they have broken the encryption and you will get unknown what. The indicator will not work correctly if it has been hacked. One friend told me that he downloaded cheaper indicators from suspicious sites, so they spoiled his expensive computer disk from all files. **Be careful !**

After purchasing in MQL5 Market, the indicator file will be saved on your computer. Find it in Terminal Navigator and double click to install on your chart. To first start, do not change anything in settings. I advise you to "play" on a demo account, set up everything as you like. Don't be afraid spoil - you can always return to the copyright settings by clicking "Reset". When you feel that you understand everything and everything is set up as it should, you can start trading.

If you are a beginner, you can trade simply when arrows appear or when you receive signals. You will quickly understand how to tune in more accurately to the current nature of the market and the broker.

If you have already read the descriptions of the indicators on the website, you can scroll further to the title **"The next screenshots show how to trade for the best result"**. It explains how to trade in order to get maximum results.

MaxiFinishTrend Free link: <https://www.mql5.com/en/market/product/38945>

This version of MaxiFinishTrend 2 gives you a free indicator service [link], but without giving trading signals. The unique author TrendLine is drawn (and customizable), but without paint in BUY and SELL colors and without show Arrows. Who understands the market movement by my fast stochastics (see [\[CodeBase\]](#)), it can trade very effectively using the free version.

If you have no desire to all understand and think a lot, buy MaxiFinishTrend 2. He will "think" for you and say when and what orders to open and close. And will send you messages on your smartphone.

In this Free version (and in MaxiFinishTrend 2):

- The signals of "Take Profit" and "Stop Loss" are given by all means.
- Works scanner, creating new charts, automatic Template and protection.
- Colored lines of fast stochastics M1, M5, M15, M30, H1, H4 are drawn for any period of the chart.
- Your orders are shown on all timeframe charts.

- Draw colored lines of support and resistance.
- Draw "PikLineBUY" and "PikLineSELL" (as it were, the last half ZigZag).
- The current size of the free "Lots" and the price of the lot in dollars in your account are calculated.
- The total profit of your orders on the chart symbol is shown.
- The recommended Take Profit is calculated after opening an order.
- Shows the current Volume[0], TICK VALUE and SPREAD of your broker in the current time.

The indicator shows up to 32 of your last closed orders and shows all open. So, today, turning on the computer, you will see the orders left earlier. The indicator will serve them and give CLOSE signals (in pay version) that are optimal in today's environment! **The indicator does everything for your success!**

The indicator will show when it is better to buy and sell stocks, metals, commodities ...

You can evaluate the convenience and functionality of the indicator before buying the full version. Her description read the link [MaxiFinishTrend 2]. At this link you can download Free-Demo version and see the work of the paid indicator in Tester.

MaxiFinishTrend 2 link: <https://www.mql5.com/en/market/product/38748>

Popular indicators give two signals - BUY and SELL, and you have to choose and put Take Profit. Usually it works quickly and the trend goes in your favor, but the indicator is "silent" until the trend change. You miss most of the profit.

The first idea of MaxiFinish : give a third signal - GET PROFIT (CLOSE) when the trend line changes the slope or the M15 and M30 stochastics have reached an extremum and the profit began to decline. If, on a signal, you have closed an order, the indicator can give a new signal in the same direction - when the trend continues, or in the opposite direction - when the trend changes. Such tactics significantly increase the result - you take profit at the highs and have more signals and deals.

The second idea of MaxiFinish is to use a compact scanner to review the market and choose where to trade, without cluttering the screen and showing where the market is now active. For the Symbols you are interested in, with one click on the scanner you create their charts with automatic installation of the indicator and Template. Trading signals you receive from all created charts . Each can be customized as you need.

The third feature : there are two more signals: when Take Profit or Stop Loss worked.

The fourth feature : this indicator Multi-Periods - it shows on any period the lines of stochastics and higher and lower timeframes - you see "through timeframes", see your orders on the charts of each period. The indicator calculates and clearly shows everything that is important for trading.

It is easy for beginners with this indicator , it is already set up on average - turn on and trade on signals .

With experience, a trader can fine-tune to the nature of the market and the broker and get fantastic results.

Signals are given on graphs and messages : sound in English , to e-mail and Push MQID to mobile. Turn on the settings that you need. On each timeframe of one symbol - other signals.

Signals are never redrawn (non repaint).

Input Settings:

Most of the names are understandable - put what you want to turn on or off. If you wish to change the colors and other properties of the graph, set COLOR_SCHEME = 3 so that your settings will be saved at the next start.

SignalLine_Main_MA_Period - for fine tuning of the main period of the signal line.

Signal_Sensitivity - to fine tune the indicator sensitivity and frequency of signals .

Your settings is automatically corrected for lower timeframes.

If there are too many arrows , set Signal_Sensitivity or Main_MA_Period more and vice versa.

If the color of the line does not switch for a long time , you need to reduce the Signal_Sensitivity. The spectacular values of this parameter are PI=3.14 multiples, for example, 1.57 or 6.28 and the like.

The arrows on the color line are not a trading signal , but you can trade on them when you are sure. The appearance of the arrow is accompanied by a beep and a window go to the top.

What you see SignalLine and the frequency of the arrows at the start, such will be the signaling. Fine tuning will provide excellent trading results.

Control and protection:

- In case of data errors in the quotes flow, get the message, for example, "**Data H4 not found!**"
- If you enter incorrect parameters, get the message "**Data Input error. Please Relnit ...**".
- When the indicator **is locked**, the icon on the green "Signal" button will **stop flashing** or the flashing rhythm will be disrupted.

!!! If you download not on the site <https://www.mql5.com>, the indicator may not work correctly !!!

Good advice:

- Choose symbols for trading where more Activity and Tick Value and less Spread.
- When you see a good profit and a big candle - close without signals. This indicator "knows" what you have closed and will give a new signal given the stochastics and the trend.
- Also, close the BUY order, having received the SELL signal, and vice versa.
- Put Recommended Take profit and Stop Loss> 28 (280) Points if you are going to turn off the computer.

The indicator works on 4 and 5 digits MT4, at any Screen DPI monitors, on all periods and symbols of Forex.

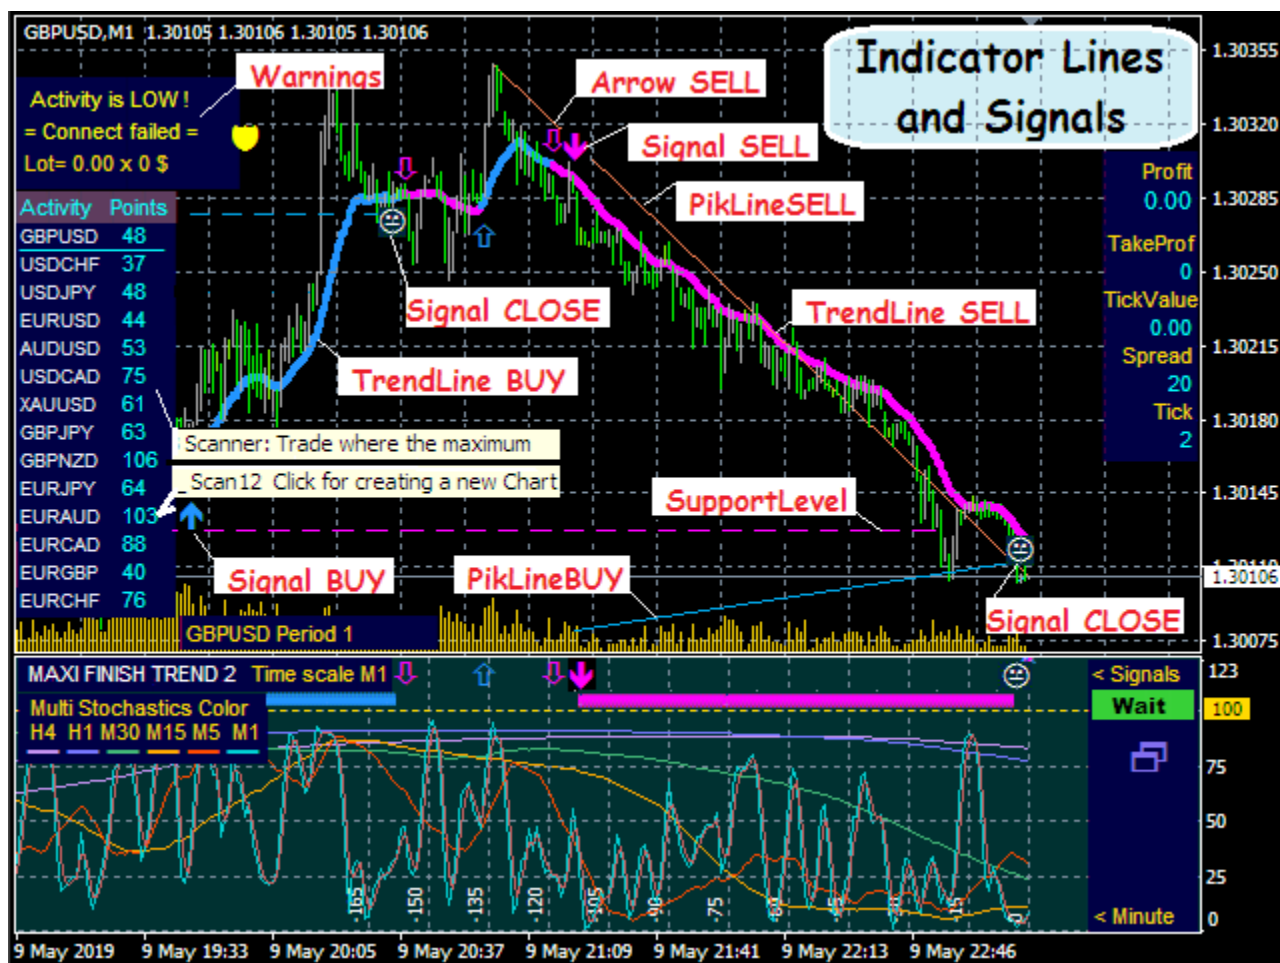

Important notes.

1. The indicator gives a signal only after closing the minute candle. Manipulation of quotes at the moment signaling does not affect it. Attempts to give false signals at the current minute are suppressed and accompanied by a beep.
2. Signals are given so, that you have 2-3 minutes to think and the time to reach the desired peak stochastic M1. Sometimes, with volatility, it is better to act immediately on Arrow.
3. In Tester, a blocking signal and orders are drawn for illustration. In fact, better open and close taking into account the higher and lower stochastics, as explained in screenshot 2. This if you want to get the maximum result.
4. When trading on periods higher M30, written in paragraphs 2 and 3 does not matter much, just act on Arrow or on signals.
5. Do not hold a lot of unnecessary charts on the screen now - close them (open again - one click). Signals from unnecessary charts will distract you.

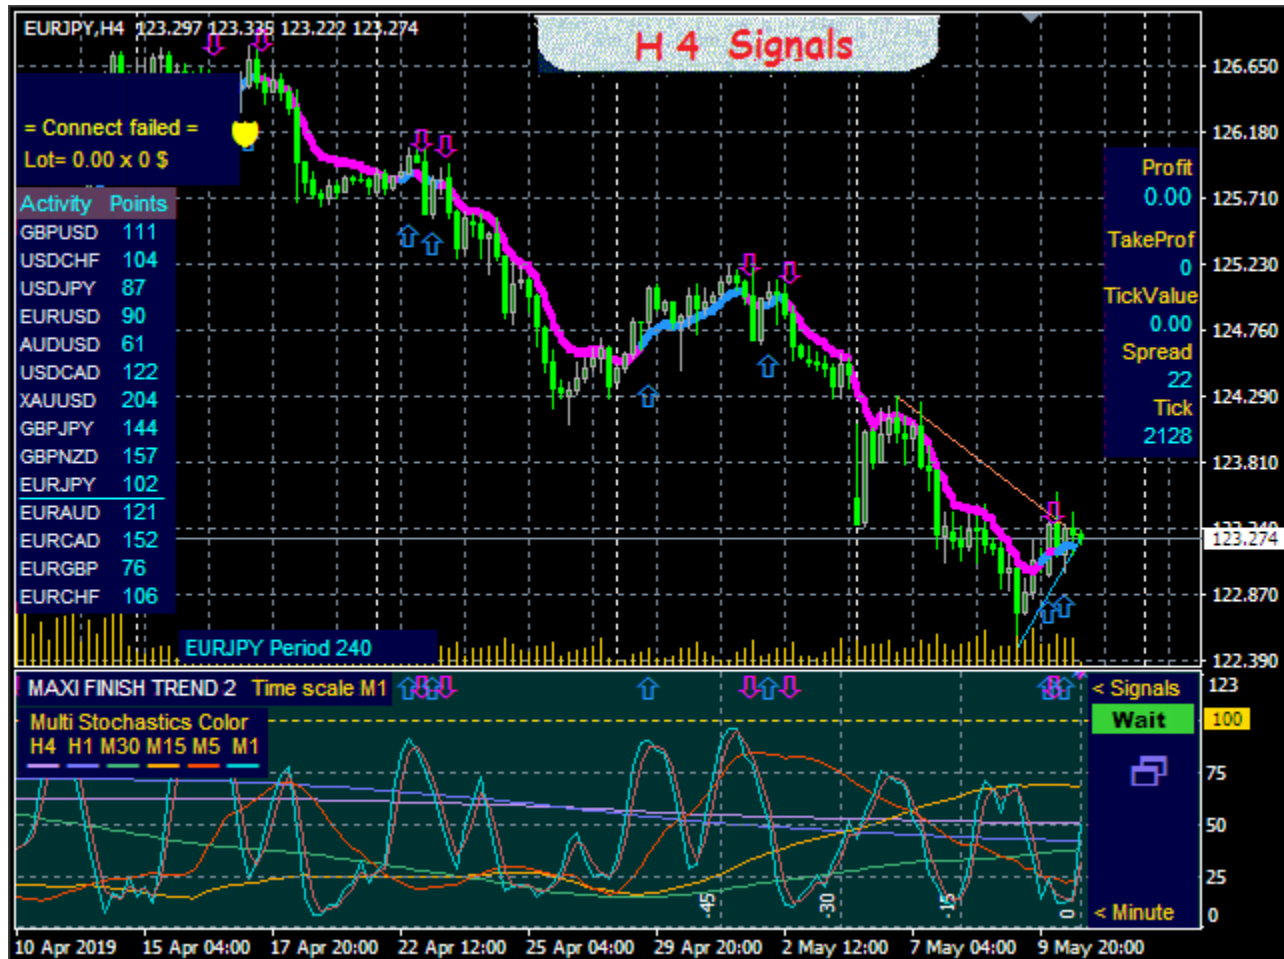

MaxiFinishTrend 2 will not stupidly give you the signals "CLOSE" when you do not have open orders, or "SELL" signals when you have already opened a SELL order, etc. The indicator monitors the actual situation and gives signals on the real price movement.

The screenshots show how the indicator works and how to trade.

About Common Inputs Colors Levels Visualization

By creating clicks on the scanner 4 charts for trade, arrange them as here, by clicking this icon

The window in which the last signal, becomes active and pops up to the top, if it was in the background.

Big screenshot: 3 charts on the screen

The next screenshots show how to trade for the best result.

*In case the signal BUY, we look at stochastic lines vice versa .

*M30 sell - when line stochastic M30 (color green) go to down.

*In case the signal BUY, we look at stochastics lines vice versa .

*M30 sell - when line stochastic M30 (color green) go to down.

*You can wait a signal GET PROFIT (Close) , if you do not want to get the maximum result.

*An optimal Activity for trade is 50 ... 500 Points (for 5-digits MT4. For 4-digits MT4 = 5...50). It is advisable not to trade if the Activity is less than $2 \times \text{Spread}$ - when the indicator draws Spread yellow color and larger font. Warning "Activity is LOW" indicator draws at Activity < 60 Points. With > 500 Points, trading is always risky. Activity values are adequate for currency pairs. For other symbols (stocks, metals...), the values are not comparable with those mentioned, but Activity < $2 \times \text{Spread}$ is fair.

Of course, you can be careful trade with any Activity.

When you trading on periods H1, H4 and higher, written with * does not matter much, you can act on Arrows or on signals.

After the start, the indicator immediately draws a color TrendLine with arrows and parameters calculated in the settings. You immediately see the current trend and can trade on color.

Upon receipt of ticks (quotes), the indicator checks each tick, and warns you if there is no any data (accidentally or intentionally).

Also, the indicator warns you if the program is blocked (possibly intentionally). Everything programs of indicators and experts operate under the control of a terminal.

Also, the indicator warns you about attempts to create a false signal. When you hear the sound accompanying appearance of an empty arrow (when the TrendLine color change), and after the sound a new the arrow does not appear - it means the indicator suppressed an attempt to create a false signal.

Each trading signal is sent once. If you missed this moment and more than 5-10 passed minutes, then you have the opportunity to update the signal. Click on the 'update' prompt on the green button signal to get a new signal in the optimal position.

When you trade on many charts at once, signals from different windows may coincide in time. Sound messages in the terminal are served so, that you only hear the last (if there is a match).

Also, consider the restrictions in the terminal on the transmission of MQID notifications - at high frequency be losing notifications. Better to use eMail.

To ensure that the indicator will work correctly without restrictions, go to the Market MQL5.com

ZUDOV.1969 2019.06.04 19:39 #2 RU ...Индикатор понравился! Работаю по нему... Очень удобная функция, когда говорит. А если в плюс то тем более! ... где прочитать про настройки окна и цвета...

Stsiapan Kreidzich 2019.06.04 22:50 #3 RU

Спасибо за отзыв. Вы забыли поставить оценку, пожалуйста откройте ваш отзыв ещё раз и кликните 5 звёздочку чтобы все засветились. Про настройки и окна прочитайте описание платной версии MaxiFinishTrend 2 и внимательно посмотрите скриншоты -там все ответы на ваши вопросы. Читать и сохранять себе на компьютер страницы вы можете бесплатно. Чтобы Ваши цвета сохранялись надо поставить в настройках COLOR_SCHEME = 3. Желаю удачи в торговле!

Ivan Marais 2019.06.14 14:54 #4 EN

Sir, I suggest directional arrows next to the "Points" Column for two or more time frames to help see direction of movement(Perhaps the paid version has all the bells and whistles)

Thanks for this very handy tool. I'm still trying to understand when best to do a trade looking at all the Stochastic lines.

Stsiapan Kreidzich 2019.06.14 16:50 #5 EN

Ivan Marais: Sir I suggest directional arrows...

Yes, arrows are drawn only in the paid version. They take into account all timeframes and all stochastics. And each arrow gives you the opportunity to earn money.

Understanding stochastics is easier if we look at M1 charts with a compressed time scale (by clicking in terminal Zoom + -). Thanks for your feedback! Best Regards !!!

Ivan Marais 2019.06.15 21:30 #6 EN

Thank you for your answer! The Multi Stochastics is a great visual tool

First have to make some money to get to the paid version, but your video looks so tempting...

Stsiapan Kreidzich 2019.06.16 00:15 #7 EN

Ivan Marais: ...your video looks so tempting...

Please, download the Free-Demo version of the paid indicator and look in the tester at any speed.

Best Regards !

Alexsandr 2019.06.22 11:52 #9 RU

Я опробовал Ваш бесплатный индикатор. Честно сказать таких я ещё не видел, отлично можно ориентироваться и зарабатывать, если сидеть около компьютера ... Не могли бы Вы одолжить Ваш платный индикатор хотя-бы на месяц...

Stsiapan Kreidzich 2019.06.22 11:52 #10 RU

Нет технической возможности "одолжить индикатор". Правильно работающий файл может быть получен только одним путём - покупкой в Маркете MQL5, где он хранится в зашифрованном виде и будет перешифрован под компьютер покупателя. Процесс автоматический. Другие пути невозможны.

Покупатель получает 8 активаций, т.е. он может повторно активировать и скачать купленный индикатор на 8 разных компьютеров - например на компьютеры 8 друзей.

Аренда на 12 месяцев стоит 125 \$. На 8 человек это по 16 \$ (на год). $16\$/12 \text{ мес} = 1.33 \$$ в месяц! Пожалуйста, покупайте на 8 человек совсем дёшево. И качайте депозиты! Желаю всем удачи!

EN

There is no technical option to "lend indicator". A properly working file can be obtained only one way - by purchasing in MQL5 Market, where it is stored in encrypted form and will be re-encrypted under the computer of the buyer. The process is automatic. Other ways are impossible.

The buyer receives 8 activations, i.e. it can re-activate and download purchased indicator on 8 different computers - for example, on computers 8 friends.

Rent for 12 months costs \$ 125. For 8 people this is \$ 16 (per year). $\$ 16/12 \text{ months} = \$ 1.33 \text{ per month!}$ Please buy for 8 people completely cheap. And pump up deposits! I wish you all good luck!

Stsiapan Kreidzich 2019.06.30 20:12 #11 RU

Более 1000 человек уже скачали и используют индикатор. Некоторые люди пишут: "...Индикатор не всегда рисует TrendLine и линии поддержки...".

Я думаю, что вы поленились оставить отзыв на сайте MQL5. Кликните вверх [Отзывы] и поставьте вашу оценку, и индикатор "не будет лениться".

EN

Over 1000 people have already downloaded and are using the indicator. Many people write: "... The indicator does not draw TrendLine and support lines ...".

I think that you are too lazy to leave feedback on the MQL5 website. Click above [Reviews] and post your evaluation, and indicator "will not be lazy".

Stsiapan Kreidzich 2019.08.01 17:06 #13 RU

В новой версии 19.9 FREE индикатора нет ограничений на рисование указанных в описании линий. Сейчас уже более 3000 пользователей индикатора, и те кто не поленился оставить отзывы, убедили меня, что всё работает отлично.

----- EN

In the new version 19.9 of the FREE indicator there are no restrictions on drawing the lines specified in the description. Now there are already **more than 3000 users** of the indicator, and those who are not too lazy leave feedback, convinced me, that everything works fine.

Stsiapan Kreidzich 2019.08.01 17:39 #14 RU

При первом старте новых версий MaxiFinishTrend, ставте номер COLOR_SCHEME, которая у вас была, чтобы ваши настройки Template оставались прежними.

----- EN

When you first start new versions of MaxiFinishTrend, set the number COLOR_SCHEME that you had, so that your Template settings remain the same.

MPHUTIGABRIEL MALETE 2019.08.22 21:15 #15 EN

The free version does not change Colour buy and sell. The signal line remains gold. Is it supposed to be like that?

Stsiapan Kreidzich 2019.08.22 23:23 #16 EN

MPHUTIGABRIEL MALETE : Please read description "...TrendLine is drawn (and customizable), but without paint in BUY and SELL colors and without show Arrows."

End Comments 'MaxiFinishTrend Free' up to 31.10.2019

'MaxiFinishTrend 2' [Comments]

mrrobert024 2019.06.27 08:26 #9 EN

This is very good. Can it handle a hedge situation?

Stsiapan Kreidzich 2019.06.27 11:21 #10 EN

Yes! You can have both BUY and SELL orders at the same time. I especially recommend hedging, when the price breaks through the level of support or resistance, and can either turn around or go further.

The indicator will show the total "Profit" for all orders on a symbol. Will show all orders at their installation points, will search and send "GET PROFIT" signals for both BUY and SELL orders. In the indicator window, when hedging, the color of the order will be shown on the signal line, which is open last.

Keep in mind, that when you already have both BUY and SELL orders, the indicator will no longer give new ones. It will search and give only signals for closing "GET PROFIT". At the same time, "TrendLine" will regardless of the orders, show the trend color, and at the points of its change there will be "ArrowSELL" and "ArrowBUY".

Thanks for excellent review of ".FREE"! Best Regards!

Stsiapan Kreidzich 2019.06.29 12:48 #11 EN

. Several buyers ask for more details on fine tuning parameters, especially for **Scalping**.

When starting a trade, maximize your window to see a longer "TrendLine". You immediately see where it changes the color and the arrows "ArrowBUY" and "ArrowSELL". This is how it will be served signals upon further price movement. If this frequency of arrows is suitable for your trading style, and the price change between the arrows is greater than $2 * \text{Spread}$, i.e. arrows "profitable", means settings correct and you can trade.

If today the market is volatile and the arrows is too much, you will lose on the spreads. To be more precise tune, call the "Properties" of the indicator and set "Signal_Sensitivity" more, for example 6.28 (for the selection, you can simply gradually increase by 1 or 2). After Init you will see how changing "TrendLine" and the number of arrows. The selection of "SignalLine_Main_MA_Period" is more rude.

If the market is too low volatile today, the color of "TrendLine" may not switch for a long time. For example, the line has long gone up, and the color remains SELL. In this case, reduce the "Signal_Sensitivity", so that color switching is not too late.

Thus, at the beginning of trading, you can tune in to the nature of the market and the broker. Of course, no one will give you a guarantee, that the nature of the market at some point can not change. Not be afraid to spoil something when setting up. By clicking the "Reset" button in the "Properties" of the indicator, you

always can return to the author's settings, that are optimized for 28 currency pairs.

With less risky trading on H1, H4 and longer, the accuracy of the setting affects less.

For scalping on M1 ... M15, it is very important to also take into account the position of the lines of stochastics, as shown in the description of the indicator "MaxiFinishTrend 2. USER MANUAL NEW".

Stsiapan Kreidzich 2019.07.02 21:09 #12 RU

. Aleksandr написал мне:

"...За два дня я удвоил депозит! Пользовался я только техническим анализом, не включая компьютерный. На M5 рисовал линии поддержки и сопротивления, а торговал на M1. К чему это я?! По привычке, на Вашем индикаторе, я проделал так-же. Но, когда переключаешь с M5 на M1 индикатор удаляет все линии..."

Объясняю как это работает.

Когда вы на чарте переключаете таймфрейм или символ, Терминал заново инициализирует все индикаторы, т.е. удаляет в окне всё и рисует заново. Линии поддержки и сопротивления (как и закрашенные стрелки сигналов), появляются только при движении цены, когда она пробивает установленные пороги. Т.е. на старте этих линий нет.

Ваш метод анализа абсолютно верный. Я сам при торговле на M1 обычно ориентируюсь (и вам советую, по M15, правда я - по стохастику M15 в том же окне M1). Таймфрейм M5 очень сильно "гуляет".

Учитывая принцип действия Терминала, Вам следует открыть на экране два окна - M1 и M5 и не переключать таймфреймы или символы в окнах, где вы торгуете и желаете не потерять стрелки и линии.

Я специально предусмотрел лёгкое создание новых окон одним кликом - создавайте для анализа новое окно и в нём щёлкайте по таймфреймам и символам для анализа.

И ещё совет от старика. Чтобы снизить риск всё потерять, **всегда держите "в запасе" столько лотов, на сколько вы открыли ордеров.** В случае резких перемен в движении цен (а сейчас экономика не предсказуема как никогда раньше), у вас должна быть возможность хеджировать ваши ордера, т.е. открыть встречные ордера на том же символе (или на движущемся аналогично). И вы будете в безопасности при любом повороте событий.

И ещё раз - желаю удачи !

EN

...Aleksandr wrote to my:

"...In two days I doubled the deposit! I used only technical analysis, not including computer. On the M5 I drew the lines support and resistance, and traded on the M1. Why is it me!?! Out of habit, on your indicator, I did the same. But when you switch from M5 to M1, the indicator deletes all lines..."

Explains how it works.

When you switch the timeframe or symbol on the chart, the Terminal reinitializes all indicators, i.e. deletes everything in the window and draws again. Support and resistance lines (like shaded arrows of signals), appear only when the price moves, when it breaks through set thresholds. Those, at the start, we do not have these lines.

Your analysis method is absolutely correct. I myself, usually when trading on M1, (and I advise it to you, using M15, although I'm - M15 stochastics in the same window M1). The M5 timeframe is very "walking".

Considering the principle of the Terminal, you should open two windows on the screen - M1 and M5 and not switch timeframes or symbols in windows, where you trade and wish to not lose arrows and lines.

I specifically provided for the easy creation of new windows with one click - create a new one for analysis window, and switch on them timeframes and symbols for analysis.

And more advice from the old man. To reduce the risk of losing everything, **always keep "in stock" so many lots, how many orders you have opened.** In the event of sharp changes in the price movement (and now the economy is not predictable like never before), you should be able to hedge your orders, i.e. open counter orders on the same symbol (or on a moving one in the same way). And you will be in security at any turn of events.

And once again - good luck!

Stsiapan Kreidzich 2019.07.27 00:18 #15 DE

. **RobertCz** 2019.07.26 22:08 # ...Klingt alles gut , wie bei der Konkurrenz auch. werde es Testen. Gibt es eine Statistik über die Zuverlässigkeit der Signale ?

Kein seriöser Trader wird Informationen über seinen realen Handel und Statistiken veröffentlichen - das ist Finanz informationen...(Ich habe Ihnen eine private Nachricht gesendet).

Danke für die Rückmeldung! Ich wünsche dir viel Glück!

Stsiapan Kreidzich 2019.08.04 01:14 #17 RU

В новой версии 19.7 MaxiFinishTrend 2 добавлена фильтрация сигналов CLOSE. Все сигналы стали точнее независимо от брокеров. Автор решил сейчас не поднимать цены, но вернуться к первоначальному.

----- EN

The new version 19.7 of MaxiFinishTrend 2 adds CLOSE signal filtering. All signals became more accurate regardless of brokers. The author decided now not to raise prices, but to return to the original.

Stsiapan Kreidzich 2019.08.17 21:17 #18 EN

In personal correspondence with a **RobertCz** buyer, he asked questions that might be of interest to everyone. He didn't mind that I published fragments of correspondence and his screenshots .

1. RobertCz:...Gibt es eine Statistik...

Author: ... For indicators, when each trader uses his tactics of opening orders (someone immediately one arrows, someone else, someone keeps track of stochastics or other timeframes, someone hedging orders, etc.), - everyone will have their own confidence statistics.

Many authors of the indicators calculate a theoretical "success rate" based on the previous period. But we know, that the market is not predictable and does not repeat. Therefore, the theoretical calculation statistics

is not reliable. For example, yesterday's USDJPY test will show the "success rate" + 90%, and Today (God forbid) an earthquake will happen in Japan. A rising JPY will fall and success put on its growth can be minus 100% ... Therefore, it is better not to trust the theoretical "success rates", but always be aware of the news and forecasts from experienced analysts and use responsive indicators, like mine.

2. RobertCz:...Is the system compatible with other indicators?

Author: ... Yes, the system does not depend on other indicators and robots. Thanks for the new screenshots - I like your Template setting!

Screenshot **RobertCz:**

I see in the screenshots, that the signals are not very accurate because the indicator work was interrupted, i.e. were reinit. Perhaps Timeframes or Symbols were switched on the chart. Read in the comments, I wrote somewhere that switching Timeframes or Symbols on a chart with signals and lines causes re-initialization and redrawing of all indicators by the Terminal. Loss of continuity of tracking and signals are less accurate. With one click you can create a new window and switch anything there for analysis.

3. RobertCz:...Is there a reason why only 14 currency pairs are scanned and not 28?

Author: ... Only 14 currency pairs are scanned, so that the scanner does not clutter the screen. Usually you will create on the screen is not one, but several windows (charts) for trading. And in each window, in the indicator settings "Input", you can write any other desired characters for the scanner. On normal screen 4 windows are well placed, and you can see the activity at once by $14 * 4 = 56$ different Symbols. To seeing 28 currency pairs is enough to create only 2 charts on the screen.

Best Regards!

Stsiapan Kreidzich 2019.09.07 23:17 #20 RU

Я забыл отметить уникальное качество этого индикатора!

Индикатор показывает до 32 Ваших последних закрытых ордеров и показывает все открытые. Так, сегодня, включив компьютер, Вы увидите оставленные раньше ордера. Индикатор будет их обслуживать и подавать сигналы CLOSE, оптимальные в сегодняшних условиях!

Индикатор делает всё для Вашего успеха!

EN

I forgot to note the unique quality of this indicator!

The indicator shows up to 32 of your last closed orders and shows all open. So, today, turning on the computer, you will see the orders left earlier. The indicator will serve them and give CLOSE signals that are optimal in today's environment! **The indicator does everything for your success!**

lucide12 2019.10.09 06:48 #21 EN

Hi I'm using the indicator on lower timeframes for scalping but each time a signal comes it jumps to that Pair and tab, resulting in lag and missclick when I want to enter a certain pair, happened a couple of times I missed an opportunity.

Can you give a small update where I have the option to turn this Off? would be of great help.

Great Indicator!

lucide12 2019.10.09 07:03 #22 EN

Also when I open a new pair/tab from the left panel it always has chart autoscroll on it, is there a way to not have this from options? That way I can scroll back and look at past, which **is very important for scalping**.

Stsiapan Kreidzich 2019.10.09 20:15 #23 EN

lucide12 : ...Can you give a small update where I have the option to turn this Off? would be of great help . Great Indicator !...

Hi! No problems!

The new version 19.9 adds the ability to **disable/enable "Chart To Top"** in the settings when a new signal.

You can disable chart auto-scrolling on any chart by pressing F8 (or by right-clicking on the chart field) and **disable "chart autoscroll"** in the chart properties on the "common" tab.

In order for your Template settings to be saved at the next starts, you need to set COLOR_SCHEME = 3 in the indicator properties. Do not forget to do the same when you first start new versions.

Thank you very much for your advice on improving the indicator! Best Regards!

-----RU

В новой версии 19.9 добавлена возможность в настройках **отключать/включать "Chart To Top"** при новом сигнале.

Авто-прокрутку графика на любом чарте вы можете отключить нажав F8 (или кликнув правой кнопкой мышки на поле графика) и в свойствах чарта на вкладке "common" **отключить "chart autoscroll"**.

Чтобы ваши настройки Template сохранялись и при следующих стартах, надо поставить в свойствах индикатора COLOR_SCHEME =3. Это же не забывайте делать и при первом старте новых версий.

Большое спасибо lucide12 за советы по улучшению индикатора!

Hi,

Rented the indicator for 3 months to see if it suits my style of trading. **So far I like it.**

Stsiapan Kreidzich:

The new version 19.9 adds the ability to disable/enable "Chart To Top" in the settings when a new signal.

You can disable chart auto-scrolling on any chart by pressing F8 (or by right-clicking on the chart field) and disable "chart autoscroll" in the chart properties on the "common" tab.

In order for your Template settings to be saved at the next starts, you need to set COLOR_SCHEME = 3 in the indicator properties. Do not forget to do the same when you first start new versions.

Thank you very much for your advice on improving the indicator! Best Regards!

Great thanks!

This is all [Comments] up to 31.10.2019...

Reading the description and discussion, **you might think that all this is so complicated ...**

In reality, this indicator automates your work as much as possible. You put the indicator on the chart and it will automatically set everything up, calculate and show everything that is important for trading.

You only need to open and close deals on time, receiving indicator signals.

To succeed, you just need to buy cheaper and sell more expensive. All price fluctuations on different timeframes are before your eyes. If all the stochastics are at the maximum, then the price will go down soon - sell so far! And then, when the stochastics are at the minimum and the price is minimal - buy!

Being observant, you gradually learn to see all the subtleties and learn to tune in to the nature of the market and broker. And when you start trading simultaneously in several currencies, observing their relationship, **Your success will be fantastic! The author sincerely wishes you this!**
