o1 Trend MA Period	10
📄 MA_Method	Simple

**We understand this EA is very complex & hope this guide will navigate you through all of the exciting features to help you be a profitable trader for years to come! Happy Trading. *The Destroy the Odds Team***

**This is the milliseconds for initiating a trade. If it is too low multiple trades may open at one time.**

**The Magic number is very important. Make sure you do not have other instances of this EA or any other EA with the same magic number.**

**Use AI Sound to turn Off or On Voices. Use Button Verification False to open your trade Immediately when clicking buttons when trading from the buttons on the chart.**

**Fix Lot will open the same lot size regardless of balance.**

**Changing this to Auto Lot will adjust your lot size according to balance.**

**X Balance Auto Lots is the amount of Balance for every Lot size in next setting if Auto Lots has been selected.**

**Fix Lot is the lot size when using the Fix Lot selection.**

**VERY IMPORTANT... This is one of the MAIN FUNCITONS of this EA. You determine what a Trending or Ranging market is here by adjusting the percentage of Symbols Trending. 95% means all of the symbols must trend to allow trades. 1 to 5% means its always Trending & Allowing Trades.**

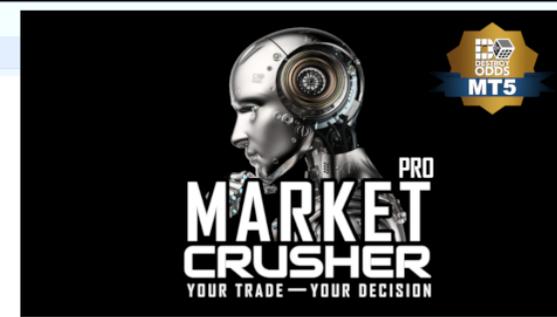

**Symbol Correlation if true will force all symbols to trade in the same direction of the Strongest Trending Symbol. If Reverse Correlation is true also it will force all other symbol to trade opposite.**

**Symbols to Trade.... Enter the symbols you want to trade here separated by a comma.**

**Never have an extra comma nor a comma at the end of the string of symbols or it will be very bad.**

**History Look back is the number of bars the EA will analyze for the trend. Max is 199.**

**VERY IMPORTANT.. Trend MA Period & MA Method is the Moving Average defining your Trend.**

↗ Auto Reversal(C)	false
ab ~	

**Close Equity Profit Points** will close the combined total of profit points for the magic number on this EA. If you have X number of trades open and the Equity for these trades reaches the points profit here all of the trades will close but it will not obey FIFO broker rules. You must have a **NON Fifo Broker** to use this setting. Close profit trade only will only close the winning trades but leave the losing trades open. **Close Equity Points Loss** does the same thing but for Equity loss.

The **SL pips & TP pips** shown here is for setting individual **Stop Loss** and **Take Profit** for each type of entry position, **A or B or C or D** and even an **SL or TP** for when you click a button to open a trade.

**Trail Start, Trail Step, Trail Above Break Even** applies to all Entries.

**Virtual TP** is a **Take Profit** method that works per symbol. This **Obeys FIFO Rules** and will work with heavily regulated brokers that require **FIFO**. **Minutes Stagnant** is if you want to target each individual symbol **Virtual TP** and if it has not closed yet it will revert to **Equity Points** to calculate all of the trades to **Take profit on Equity Points**. **Symbol Profit Points** is another Type of **VTP**.

**Delay after Previous Open** will define how many minutes you want to delay the EA from opening another trade for each of the **AUTO** entry settings **A or B or C or D**. **Delay Grid** will work only if you enable the grid setting.

**VERY IMPORTANT HERE**. This is where **YOU** define how many bars are in a trend based on the **Trend Moving average** you set earlier in these setting and based on the percentage of symbols trending setting. **Define Trend Range** is the **Range of Bars** that the EA will allow a trade to open.

**Long or Short Allows** you to trade only **Long or Short or Long and Short**.

**Auto open A True** will open all **Trending Symbols** within the **Range** that was set. **Auto open B** will only open the **strongest trending Symbol**. **Auto Open C** will open when the candle crosses the **Trend Moving Average**.

01 Less than X Bars Invert True More Invert False	100
ab ~	
01 More than X Trades Reduce Equity TP	0
👉 Block trade if Symbol is in loss.	false
ab -	

**Auto Open Correlation Gap True will only work with 2 or 3 symbols. Do not have more than 3 symbols in the symbol setting. The first 2 symbols should be heavily correlated. The 3rd symbol is optional and is usually a cross pair. Example EURUSD,GBPUSD,EURGBP. Invert Correlation false will trade buys above the trend line and sells below. True will reverse this. Invert 3rd Symbol true open buys above the trend line and sells below. True will reverse this. Correlation Min Gap pips is the min pip distance from the trend line to open. Max gap pips is the maximum. Min Bars and Max bars is the same concept but counts the bars in the trend. Correlation gap 3rd symbol X minutes will only open the 3rd symbol after this X number of minutes.**

**Use Strongest Symbol is only used for the C Auto Entry Setting. If true it will take the MA cross for the Strongest Symbol that crosses over the MA to take the Strongest Reversal. If set Strongest symbol false and use range true it will take these reversal trades on ALL of the symbols that cross the MA instead of just 1 at a time. Invert C trade is to take the trade in direction of the previous trend when the candle crosses the MA. Consecutive Bull/Bear Bars will only open when X Bull Bars = Buy or C Bear Bars= Sell and this is for A or B or C Entry. Optional Grid Settings.... Open Grids on X minutes Stagnant. 0 Grids never open. 1 grids can open after 1 minute. 60 minutes then Grids can open after 60 minutes. 1440 minutes then grids can open after 1 day. Grid Distance is min distance for grids when using Grid distance in drop down(default is using Average price) Max Grid is the max number of grids allowed.**

**Max Open Symbol Count is the total number of symbols allowed to be open at any one time. Allow X trades per Symbol to open will allow up to this number of trades for each symbol to be open at any one time. Allow X trades to open(Symbol 3 on D entry) is ONLY for D Entry Open when using a 3rd symbol. It will only allow up to this number of 3rd symbol trades. Allow hedging true will allow all symbols to hedge when they get a signal to open.**

**VERY IMPORTANT HERE. Pay attention or you will get confused here. Invert Trades by trade count or bar count will invert the trading entry after X number of trades or bars open. If these are both false the signal is always following the trend. If true it will start with mean reversion and when it reaches the target trade count or bars count in the trend it will follow the trend.**

**More than X trades reduce Equity TP. If 0 it always uses Equity TP points. If you set this to a number it will count how many trades you have open and calculate Equity TP points per trade until this number is reached and then revert back to the Equity Points value for all trades together.**

**Auto GMT will force your time to work with the EA GMT offset. This is not what you may be used to so please message us for clarification if you do not understand. We set this to GMT3 for Daylight Savings time in the Spring and GMT2 for DST in the fall. This can change if USA gets rid of DST in 2022. Please pay attention to this every spring and fall.**

**Start hour and Start Min is when the EA will look for trading entries.  
End hour and End Min is when the EA wil stop looking for trading entries.**

**Start minute Filter and End Minute filter will only look for trades each hour between these start and ending minutes each hour. Maybe you want to trade 25 minutes to 35 minute in each hour and not trade all through every hour.**

**Close on X hour and X minutes will close all open positions that day on this hour/minutes.**

**Close All trades Outisde Trade hours will close all open positions as soon as the End hour and End Minutes is reached for that day.**

**Trading Days. Set true to trade that day. Set false to not trade that day.**

**Close Friday hour and Min will close all open positions on Friday on this hour and minute. 0 disables this.**

**Volatility Settings..... This is the setting to adjust the sensitivity for the Volatility Indicator you see on the chart. When the Buttons change from dark to bright it means that symbol is in high volatility for that timeframe. Setting the Period to current it will detect volatility on your current time frame. Use Auto Volatility Filter will filter your auto trading entries to only allow the trade to open when it is in high volatility if this is set to true.**
