Pending Manager Pro

A simple guide to the chart interface

Find the pending orders you need, review the exact tickets, and manage them from one clear MT5 workspace. This guide explains the chart controls and the nine inputs in Pending Manager Pro.

FILTER > SELECT > REVIEW > CANCEL

Start in five steps

1. Open ACCOUNT. Use Sample preview = false for your account. Built-in sample data is available from the top button.

2. Set cancellation permission when you need it. Press F7, set **Enable pending cancellation = true**, and choose **Manage scope**. Turn on MT5 Algo Trading and allow trading for this EA in Common.

3. Find the right orders. Set Symbol, Magic or Comment and click Apply.

4. Select and review. Tick the tickets or use Select matched, then click **Cancel selected...**

5. Confirm and check. Review the frozen tickets, press CONFIRM CANCEL N, then read Batch results.

Viewing only? Keep Enable pending cancellation = false. Viewing, filters and selection CSV work with trading actions off.

F / Check uncertain results
F7 / All nine inputs
Examples and FAQ

Images use native PMP sample screens with guide numbers. Review and uncertain-result examples are staged locally.

A / Overview and navigation

Red numbers match the A references on the following pages. Native sample-data screen.

A / Button reference

Start with the three cards: ACCOUNT PENDING ORDERS shows the whole account, FILTER MATCHES shows the current view, and SELECTED TICKETS shows your chosen tickets. The account card also shows the broker limit and remaining capacity when the broker reports a limit.

The symbol cards follow the current filters and source view. Lots show order volume; compare them within the same symbol.

Ref.	On the chart	How to use it
A1	**ACCOUNT / SAMPLE PREVIEW**	Switch between your account and built-in sample data. Switching clears ticket selection; apply or reset unfinished filter edits first.
A2	**Compact / Fill chart**	Use a smaller panel or fill the chart. Drag the lower-right resize grip for a custom size.
A3	**Manual**	Show native desktop, mobile and web manual orders, plus any manual execution-panel Magics you assigned in Inputs.
A4	**EA / script**	Show program-origin orders, excluding the execution panels you mapped to Manual.
A5	**Unknown**	Show orders with an unclassified native origin. Review their ticket details before choosing a management scope.
A6	**All sources**	View every origin while keeping the other filters. Your cancellation permissions still come from Inputs.
A7	**Expand table / Pending orders >**	Open the larger pending-order list. On shorter charts, Pending orders > opens the list from the summary view.
A8	**SYMBOLS**	Open or fold the symbol cards. The fold preference is saved locally.
A9	**Symbol**	Sort the symbol cards alphabetically. Click again to reverse the order.
A10	**Count**	Sort the symbol cards by matching pending-order count. Click again to reverse.
A11	**Lots**	Sort the symbol cards by matching pending lots. Click again to reverse.
A12	**< / > beside the symbol cards**	Move between groups of up to three symbol cards. This pagination is separate from the order table.
A13	**Symbol card**	See pending count, total lots and buy/sell lots. Click a card to apply its symbol alongside your other filters.
A14	**// resize grip**	Drag to resize. The panel needs at least 800 × 530 logical pixels; a larger chart or lower UI scale gives it more room.

B / Find orders with filters

Red numbers match the B references on the following pages. Native sample-data screen.

B / Button reference

Use Symbol, Magic and Comment together to narrow a crowded account. For example, choose EURUSD, enter Magic 1001 and use PNG break with Contains to find that specific group.

Conditions in different fields combine with AND. Multiple symbols or Magic numbers within one field combine with OR. Comment matching ignores letter case.

Ref.	On the chart	How to use it
B1	**SYMBOL(S)**	Enter exact broker symbol names, separated by commas. Include suffixes, for example EURUSD.a,GBPUSD.a. Leave blank for all symbols.
B2	**... symbol chooser**	Search and select broker symbols instead of typing their exact names.
B3	**MAGIC NUMBER(S)**	Enter exact Magic numbers separated by commas, such as 12345,67890. This field filters the view.
B4	**COMMENT**	Enter a comment word or full text. PNG break with Contains also finds PNG break_1 and PNG break_2.
B5	**COMMENT MATCH**	Choose Contains, Exact match or Excludes. Choosing an option closes the menu and applies the filters.
B6	**ORDER TYPE**	Choose All types or Buy/Sell Limit, Stop or Stop Limit. The selection applies the filters.
B7	**Apply**	Apply edits to Symbol, Magic and Comment. Check the matching count before selecting tickets.
B8	**Reset**	Clear filter conditions and ticket selection. Keep the current source tab and the permissions set in Inputs.
B9	**More filters / Less filters**	Show or hide the saved-filter and quick-filter controls. Active quick filters continue to apply while folded.
B10	**Save filters**	Save one applied filter preset for this account. Saving again replaces it. Sample data has a separate preset.
B11	**Load filters**	Restore that preset, including its source, type and quick filters. Loading clears ticket selection.
B12	**Magic 0**	Add an exact Magic 0 condition to the current view. Native origin still determines the source classification.
B13	**No comment**	Find orders whose comments are empty or contain only spaces.
B14	**< Columns / Columns >**	Move horizontally through the available table columns while keeping the selection column in place.

C / Select tickets in the expanded table

Red numbers match the C references on the following pages. Native sample-data screen.

C / Button reference

The expanded view gives the ticket list more room. Select a few checkboxes or use Select matched for the full filtered set, including other pages.

Ticket selection stays attached to ticket numbers when you sort or change pages. Orders arriving later require a fresh selection.

Ref.	On the chart	How to use it
C1	**< Overview**	Return to the overview with your selection and filter draft. Escape also returns after any open menu is closed.
C2	**Filters / Hide filters**	Show or hide filter fields in the expanded view. Existing conditions remain active.
C3	**Table headings**	Click Ticket, Symbol, Type, Lots, Trigger price, Stop-limit, Origin, Magic, Comment, Created or Age to sort. Click again to reverse.
C4	**Row checkbox**	Select or clear one pending ticket. Use Select matched for selection across pages.
C5	**Select matched (N)**	Select all currently matching tickets across every table page. Check the total selected count before review.
C6	**Clear selection**	Deselect every selected ticket while keeping your filters.
C7	**Save selection CSV**	Export exactly the selected tickets, including symbol, type, source, Magic, comment, lots, prices and times.
C8	**Cancel selected...**	Open a review of the selected tickets after the permission checks. A selection gives this button a red tint.
C9	**Batch results**	Open the latest recorded batch to inspect ticket outcomes and messages.
C10	**Previous / Next**	Change table pages while retaining ticket selections.
C11	**< Columns / Columns >**	Move through table columns on narrower panels. Hover over a row value for more ticket details.

The + at the left labels the selection column. Use Select matched for the full matching set. The red tint of Cancel selected... marks the destructive action; permission checks still apply.

D / Choose symbols by searching

Red numbers match the D references on the following pages. Native sample-data screen.

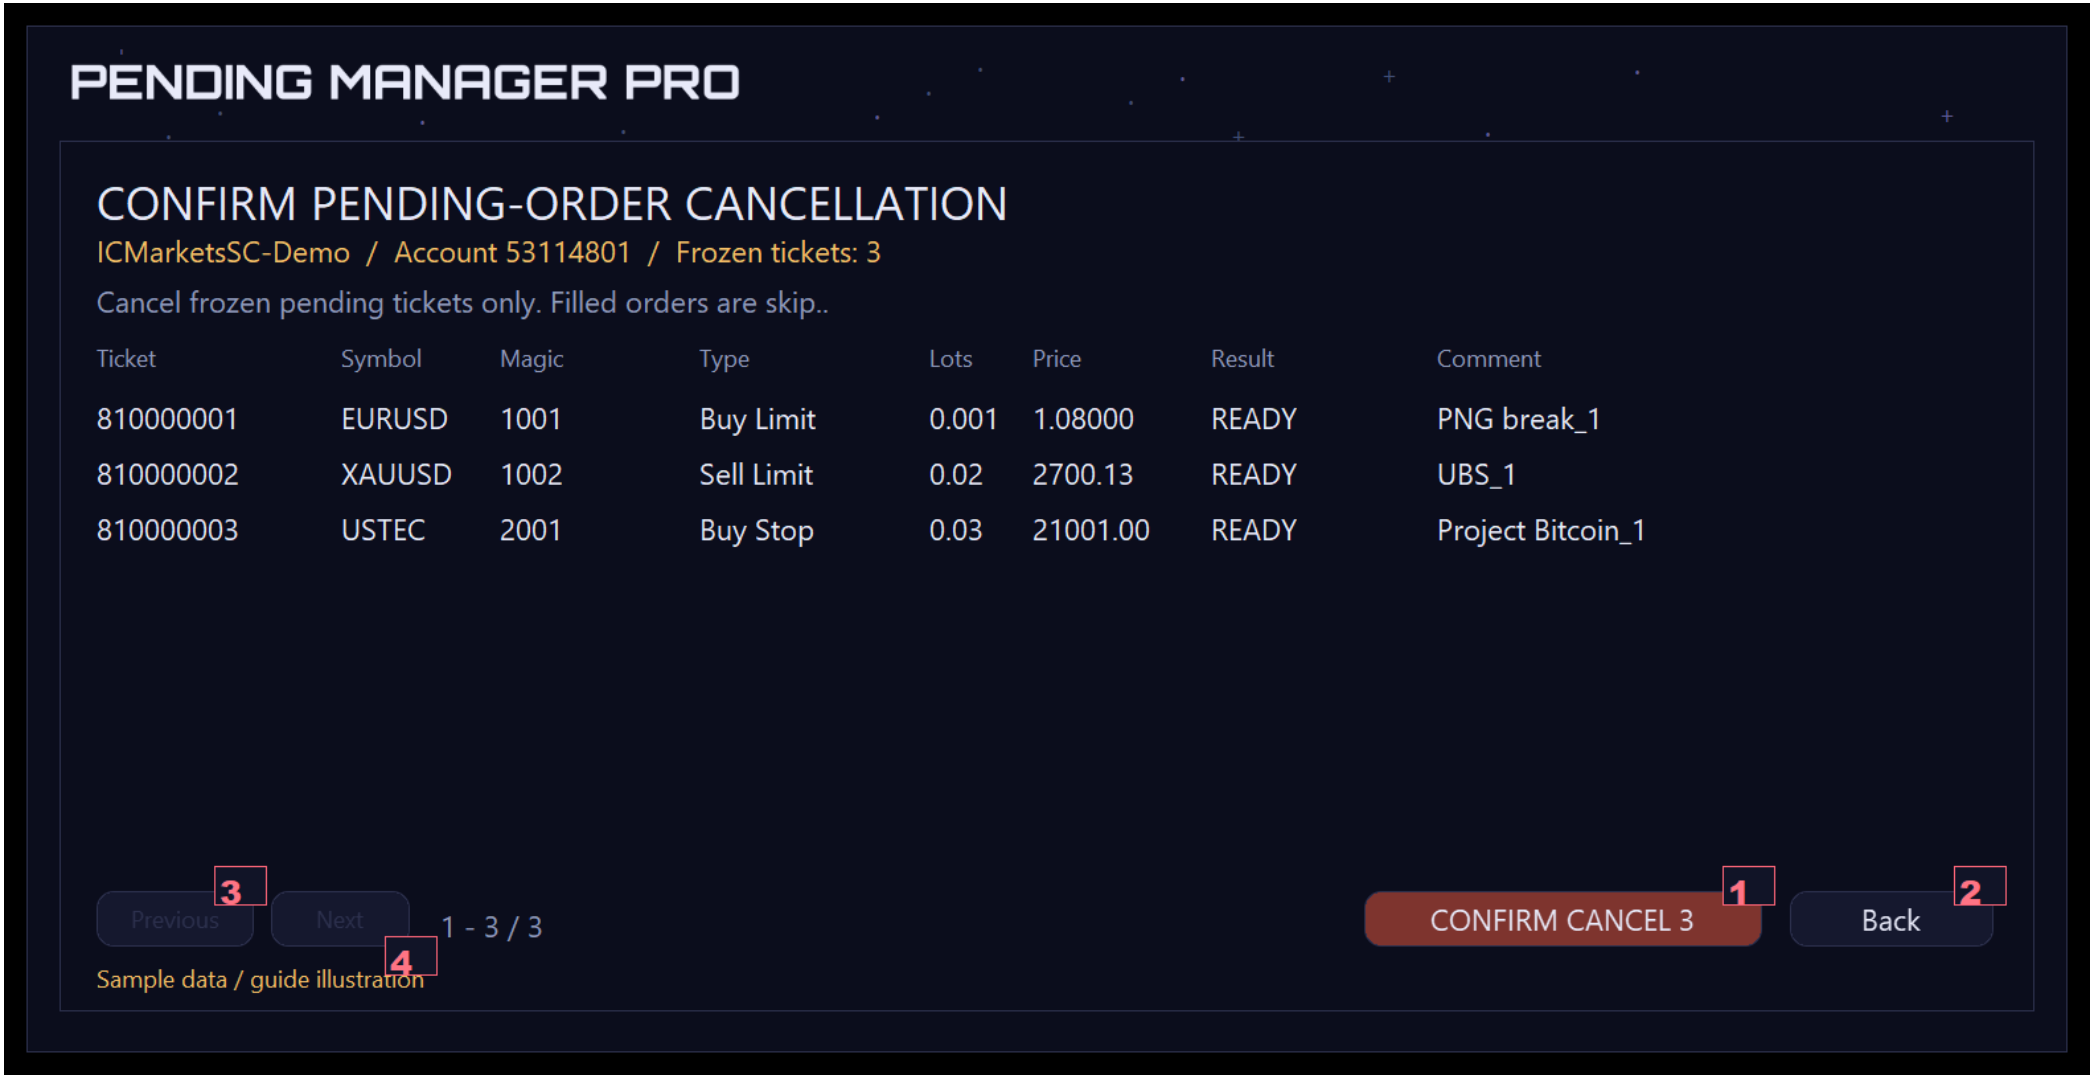
D / Button reference

Click... beside SYMBOL(S) to open the chooser. Symbols with pending orders appear first, with their counts. Other available broker symbols can also be selected.

The chooser search accepts part of a symbol name. After Apply, the main filter uses the exact selected names.

Ref.	On the chart	How to use it
D1	**SEARCH**	Enter part of the broker symbol name, such as USD or XAU.
D2	**Search**	Update the choices and return to the first results page.
D3	**Symbol rows**	Check or uncheck symbols. Pending shows the number of orders for that symbol in the active dataset.
D4	**Clear**	Deselect all symbols in the chooser. Use Apply to commit that selection.
D5	**Apply**	Transfer the selected names to SYMBOL(S), apply the filters and close the chooser.
D6	**Back**	Return without applying the chooser edits. Escape also closes the chooser.
D7	**Previous / Next**	Page through the symbol choices while keeping the symbols you checked.

E / Review cancellations and read results



Review example staged from sample tickets. No broker requests were sent.

E / Button reference

Cancel selected... opens a ticket review. Check the account, symbols, volumes and comments, then use CONFIRM CANCEL N to submit that frozen set. Each ticket is checked again before its cancellation request.

The review lasts 30 seconds. If it expires, reopen it and review again. A pending order that has already filled is skipped; manage the resulting position separately.

Ref.	On the chart	How to use it
E1	**CONFIRM CANCEL N**	Confirm the exact reviewed tickets. N is the number in this review.
E2	**Back / Close**	Leave an unconfirmed preview or close the results window. For a running batch, use Stop remaining to stop unsent requests.
E3	**Previous / Next**	Page through the frozen ticket list and its per-ticket results.
E4	**Result message**	Read each ticket result and the batch message. The saved audit and result CSV files provide the detailed local record.

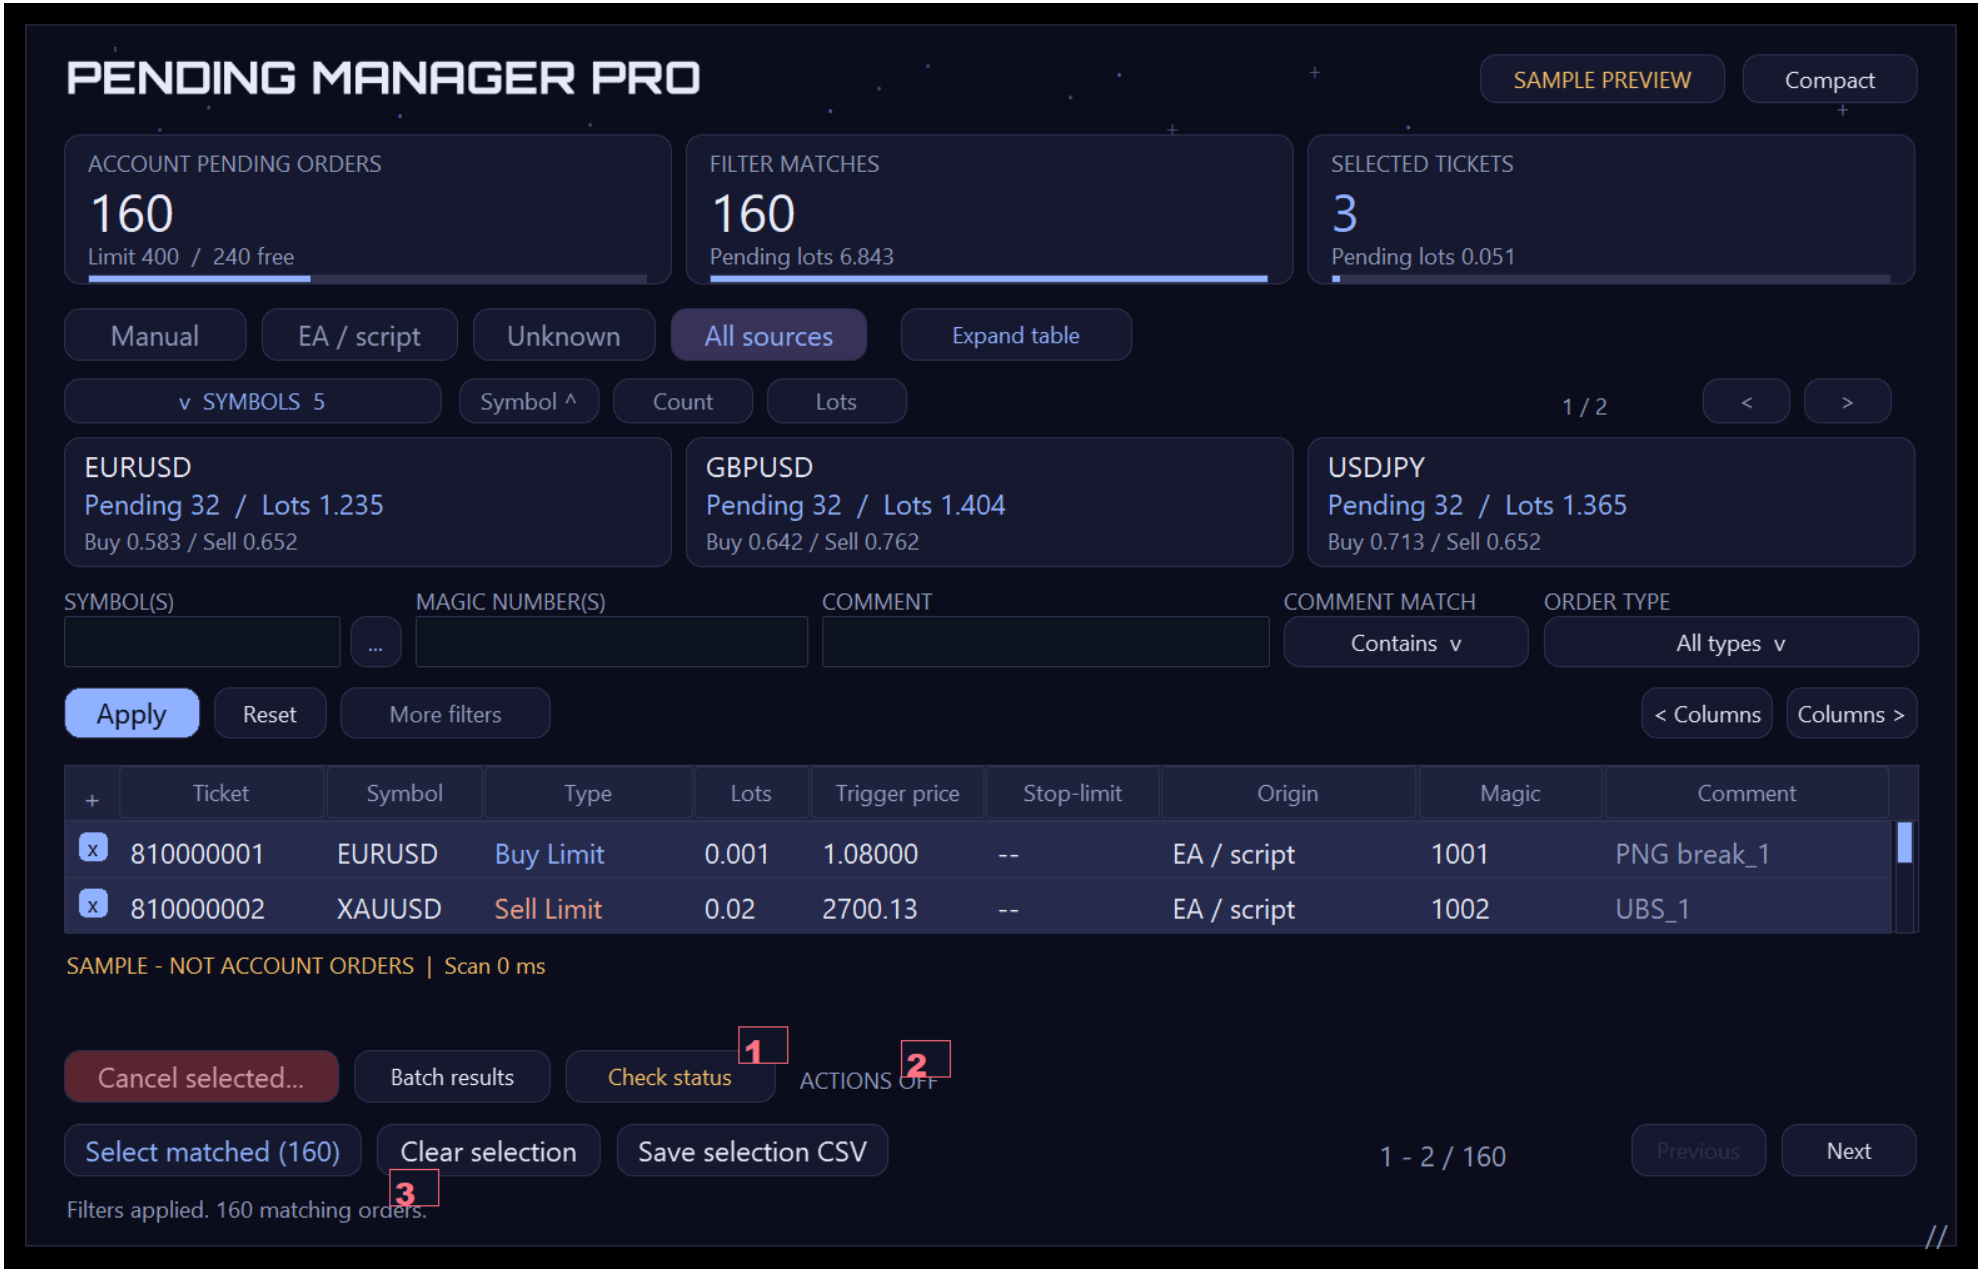
While a batch is running

Stop remaining appears in the action area and the batch window. It stops unsent requests; use Batch results to follow any request already in flight.

Reading results

Done means confirmed completion; Skip means a ticket was changed or gone; Fail means a known failure; Unknown needs a status check; Unsent means no request was sent for that ticket.

F / Check uncertain results



Illustrative uncertain result showing the conditional Check status button.

F / Button reference

Check status appears directly beside Batch results in the pending-order table when an earlier batch has an uncertain outcome and is no longer running. On a short-chart summary, open Pending orders > first. Click Check status to compare those results with broker order and deal history and update the result CSV.

Known failures are shown in Batch results. Check status confirms uncertain outcomes; it sends no replacement cancellation requests. File errors show FILE ERROR / BLOCKED with a diagnostic message.

Ref.	On the chart	How to use it
F1	**Check status**	Check uncertain recorded results against broker history. Reconnect first if the terminal is offline.
F2	**Permission / batch status**	Read ACTIONS OFF, ACTIONS ON, BATCH RUNNING or a blocked-state message. ACTIONS ON reflects the input switch; MT5 permissions are still checked.
F3	**Message line**	Read the latest action or file message. After a CSV export, hover here to see the full saved path.

F7 / All nine inputs

Start with the defaults for viewing. For cancellation, focus on Enable pending cancellation and Manage scope, then fill only the Magic settings relevant to that scope.

No.	Input name in MT5	Default	What to set
1	**Sample preview**	false	Start with account orders. Set true to explore built-in sample data; the top dataset button also switches the view.
2	**UI scale (%)**	100	Choose 80-150. Start at 100 and adjust for your chart size.
3	**Enable pending cancellation**	false	Set true to enable reviewed cancellations. Also turn on MT5 Algo Trading and allow trading for this EA in Common.
4	**Manage scope**	PS_MANUAL	PS_MANUAL covers native manual orders and mapped manual panels. PS_ALLOWLIST covers Allowed Magics. PS_ALL covers all sources, subject to protection and the Magic 0 setting.
5	**Max tickets per batch**	50	Choose 1-1000. A selection larger than the limit is rejected; reduce it or deliberately increase this value.
6	**Allowed Magics**	Blank	For PS_ALLOWLIST, enter a nonempty comma-separated list, such as 12345,67890. Use the chart Magic filter separately to narrow the view.
7	**Protected Magics**	Blank	Enter comma-separated Magics to protect in every scope. Protection takes priority; including 0 protects Magic 0 tickets too.
8	**Allow Magic 0 outside Manual**	false	Extra permission for Magic 0 in PS_ALLOWLIST or PS_ALL. In PS_ALLOWLIST, include 0 in Allowed Magics as well.
9	**Manual execution-panel Magics**	Blank	Optional nonzero Magics used by your own manual execution panels. Their program-origin orders join the Manual view and PS_MANUAL scope; Origin keeps the native source label.

For native manual orders, PS_MANUAL works with the default empty Magic lists. A mapped execution panel keeps its native Origin label while joining the Manual view.

Two everyday workflows

Find one EA's pending orders

Choose EA / script. Enter that EA's Magic and a distinctive comment word, such as UBS or PNG break, then click Apply. Review the matches and select the exact tickets. To permit their cancellation, use PS_ALLOWLIST in Inputs and add the EA's Magic to Allowed Magics.

Organize native manual pending orders

Choose Manual and use a symbol card or the symbol chooser. Keep Manage scope = PS_MANUAL for cancellation. Use Magic 0 or No comment only when you want those extra view conditions.

Remember: Chart filters decide what you see. Manage scope and the Magic settings decide which tickets are eligible for cancellation.

Quick answers

Which orders appear in PMP?

PMP displays all six MT5 pending types supported by the account: Buy Limit, Sell Limit, Buy Stop, Sell Stop, Buy Stop Limit and Sell Stop Limit.

How often do the counts update?

The chart view refreshes about once per second while the terminal and EA are running. The account card counts the whole account; filtered cards and the list follow your current view.

Can I view orders with Algo Trading off?

Yes. Viewing, filters and selection CSV work with trading actions off. Sending cancellations requires the input switch, MT5 Algo Trading and the EA/account permissions.

Does All sources let me cancel every EA’s orders?

All sources controls the view. Manage scope, Allowed Magics, Protected Magics and the Magic 0 setting control eligibility for cancellation.

Are Magic 0 or empty comments always manual?

The Manual, EA / script and Unknown views use the native order origin, with your optional manual-panel mapping. Magic 0 and No comment are independent filters.

Where are CSV files saved?

Use MT5 File → Open Data Folder. Selection exports are under MQL5/Files/OrbitTradeManager/Pro/Exports, tool errors under OrbitTradeManager/Pro/Diagnostics, and batch audit/result files under TradeManager/Audit, all within MQL5/Files. Hover over the saved message for the exact path.

What happens when I press Stop remaining?

The tool stops requests that have not been sent. Completed cancellations stay completed, and an in-flight request may still finish. Use Batch results to check each ticket.

Does PMP manage open positions or calculate account risk?

PMP focuses on pending-order search, volume/count summaries, reviewed cancellation and CSV records. Position closure, SL-risk comparison, margin monitoring and schedules belong to Ultimate Order Manager. For more details, please visit my seller profile.
