TPSW User Manual

MetaTrader 5 | EURUSD H1 worked example

Use the full standalone TPSW indicator on a regular desktop MT5 chart for this example. The MQL5 Market demo is limited to visual testing; see page 3.

1 Install TPSW and open EURUSD H1

MQL5 Market: Sign in to MT5 with the MQL5.community account that acquired TPSW. Open Market, find TPSW in your purchases and click Install. In Navigator, find TPSW under Indicators and attach it to EURUSD on H1.

Direct download: If your Rocksolid package provides an EX5, use File > Open Data Folder and copy the supplied file into MQL5/Indicators. Refresh Indicators in Navigator, then attach TPSW. Use the Market installer for Market purchases.

2 Choose and activate a candle

Open Controls and click Historical review: expand. Click Pick Candle, then click a loaded candle on the chart. In this example, pick the EURUSD H1 bar opening 4 November 2026 at 20:00, in broker chart time. Click Activate selected candle: 2026.11.04 20:00. Confirm the badge reads REPLAY. Picking alone does not activate the selection.

EURUSD H1 storefront screenshot. Historical Review is expanded and the 20:00 candle is active. Scroll the panel with Down to reveal controls below Previous host bar.

Step through the windows

Historical Review and higher timeframe context

3 Move one H1 bar at a time

Click Previous host bar once. On continuous H1 history, the selected candle open moves from 20:00 to 19:00. Click Next host bar once to return to 20:00; click it again to reach 21:00 if loaded. Check the selected time after each step. The buttons follow loaded bars and skip gaps. Up and Down scroll the panel, not the replay cutoff.

4 Return to the current chart

Click Return to Live. The panel should leave REPLAY and rebuild the current view. Historical Review changes the analysis cutoff; it does not change the broker clock or place orders.

Time Zones

In Controls, turn Time Zones on and click Time Zones controls: expand. Select H4 with the Time Zones Source control. The dashed vertical lines show projected times from the selected swing sequence. For example, H4 C > D 2x projects twice the C-to-D time span from C. The date labels mark time references. Recent Zigzag anchors can revise and the displayed set can change in Live.

Rhythm Chamber

Turn Rhythm Chamber on and click Chamber controls: expand. For an H4 Chamber window on an H1 chart, use Follow host: OFF, select H4 in the Chamber Source control, and set MTF: OFF for a single-source view. Check each layer’s source separately: H4 Time Zones can appear alongside a Chamber band from another timeframe.

With Time band: ON, the shaded band shows the selected Chamber window from confirmed swing evidence. Its left edge is the start, its centre line is the centre, and its right edge is the end. Journey explains the window and its timing when available. In Live, another eligible window may be selected as time advances.

Chart scrolling can move a fixed timestamp across the screen. A time window does not imply a price target or a trade signal.

Market demo and troubleshooting

Desktop MetaTrader 5

Market demo: visual Strategy Tester only

Download the demo from the TPSW Market listing. Open Strategy Tester, select TPSW as the indicator, choose EURUSD, H1 and an interval with sufficient history, then start visual testing. A Market indicator demo cannot attach to a regular online chart, even on a broker demo account.

Pick Candle is unavailable in the Tester. For Historical Review there, set InpReplayCandle before starting to the exact opening time of a loaded host bar that the simulation can reach. Provide earlier history for the source timeframes. The demo lets you inspect the historical display; the regular chart walkthrough on page 1 uses the full indicator.

If something is missing

TPSW is not in Navigator: check the Community account for a Market install. For a supplied EX5, check the data folder of the MT5 installation you are using and refresh Navigator.

Review controls are offscreen: open Controls, expand Historical Review and use Down. Enlarge the chart pane if controls cannot fit.

No line or band: check that the layer is enabled, check the source separately for each layer, and allow history to load. In Replay, confirm the selected time is an actual bar open and the panel shows REPLAY after activation. Treat unavailable readings as unavailable.
