

## How to create a chart template (.tpl) for the Divergence scanners

Please first download my free divergence indicator:

MT4 version: <https://www.mql5.com/en/market/product/68510>

MT5 version: <https://www.mql5.com/en/market/product/68509>

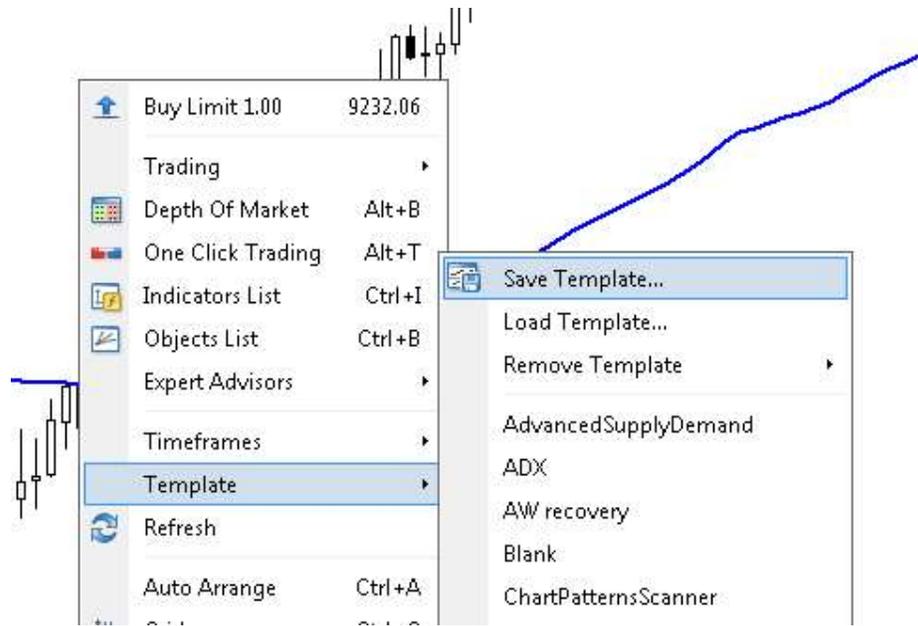

The easiest way is to install it from the Metatrader terminal.

Open a new chart. It doesn't matter which symbol and time frame. Remove/add any other indicators you would like on the chart. For instance Moving averages.

Lookup the free indicator under the Market folder and double-click on it. A window with the input parameters will open up. Please adjust the settings so that they correspond with the settings you currently have in the scanner. Then click on the OK button.

Now right click on the chart and select Template – Save template... from the pop-up menus.

Give the template a name. For instance DivergenceScanner.tpl. Switch to the chart where you have installed the scanner and hit the Ctrl+I keys on the keyboard. Double-click on the scanner indicator to open up the window with the input parameters. Please put the name of the newly created template in the Template name parameter. That's it!

Variable	Value
ab GE_Ex	===== GENERAL SETTINGS =====
123 Panel width	200
ab Template name	MyCustomChartTemplate.tpl
ab FS_Ex	===== SIGNAL SETTINGS =====
