EA Volcano is a very advanced, full auto trading algorithm that is designed to maximize your trading potential and to minimize emotional trading. The system will add trades in the direction of the trend until it hits Take Profit according to settings.

Please Note:

This EA must be run on a lot multiplier of 2 and without a Stop Loss to function properly according to the strategy!!

Mt5 should be run in TEST MODE!!

(You may add trades using panel on chart if you are fairly sure about direction. The TP is in money and not in pips!)

BEST PAIRS: xauusd (best pair); can also work on Gbpjpy

1. Make sure you know if the gold price of your broker is 2-digits of 3-digits for gold so that you can choose the right set file

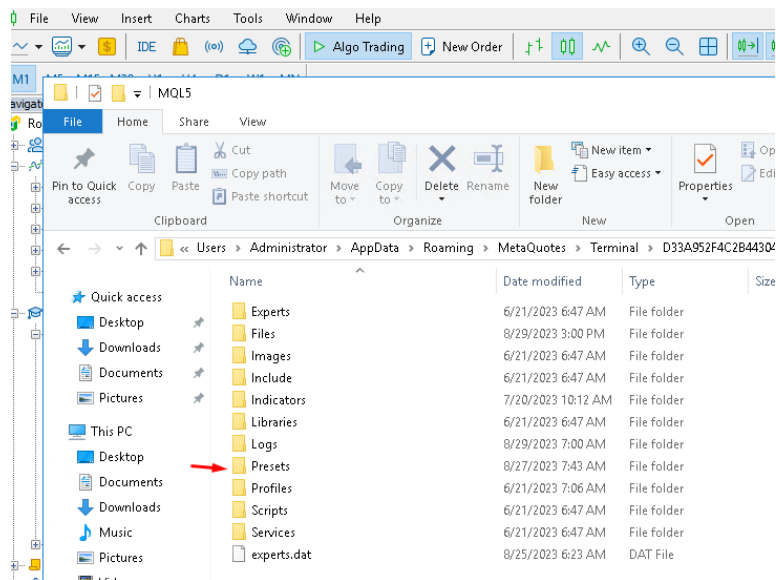

j) What is the difference between 2-digit and 3-digit charts

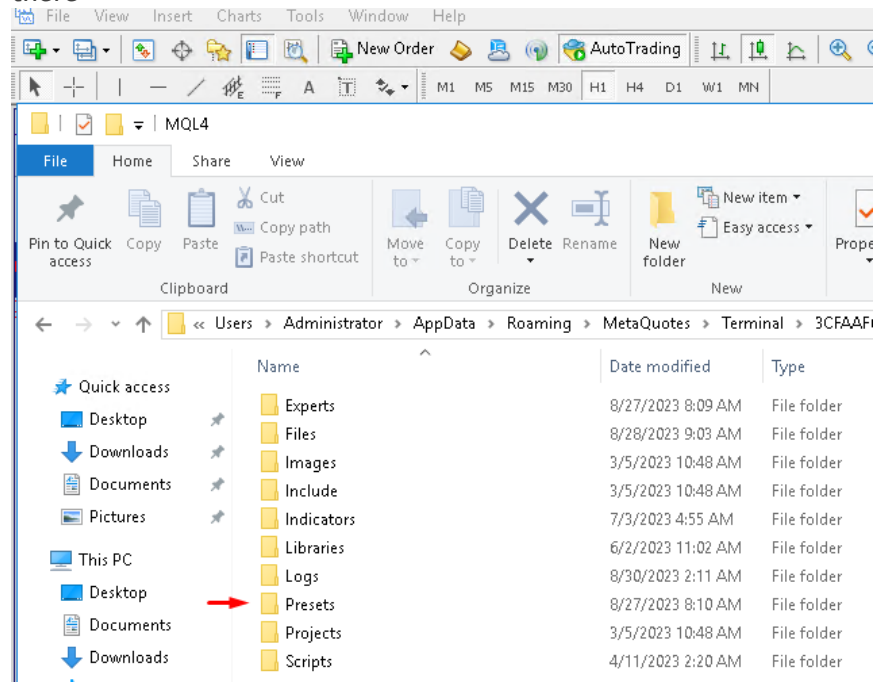

There are 2 digits after the dot in the price of a 2-digit chart and 3 digits after the dot in the chart of a 3-digit chart.

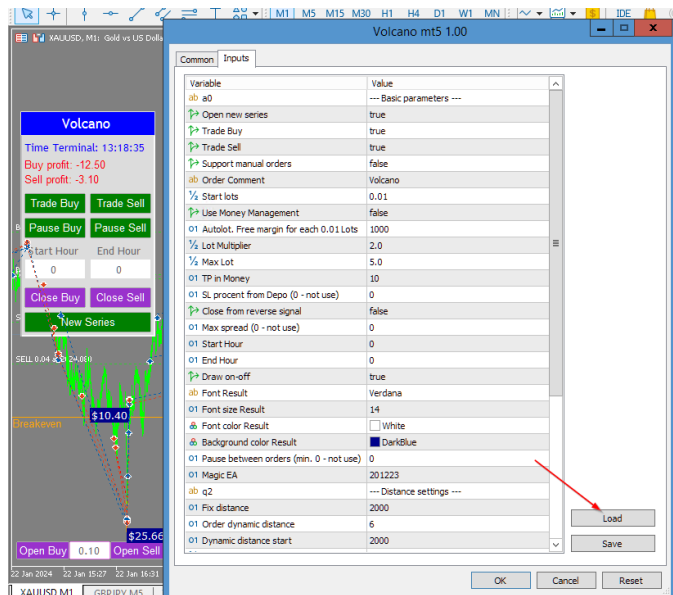

2. Install the set files:
For Mt5: Go to “File”; “Open Data folder”; MQL5; “Presets” and drop your set files there. **(Please note that mt5 should be run in TEST MODE!)**

3.

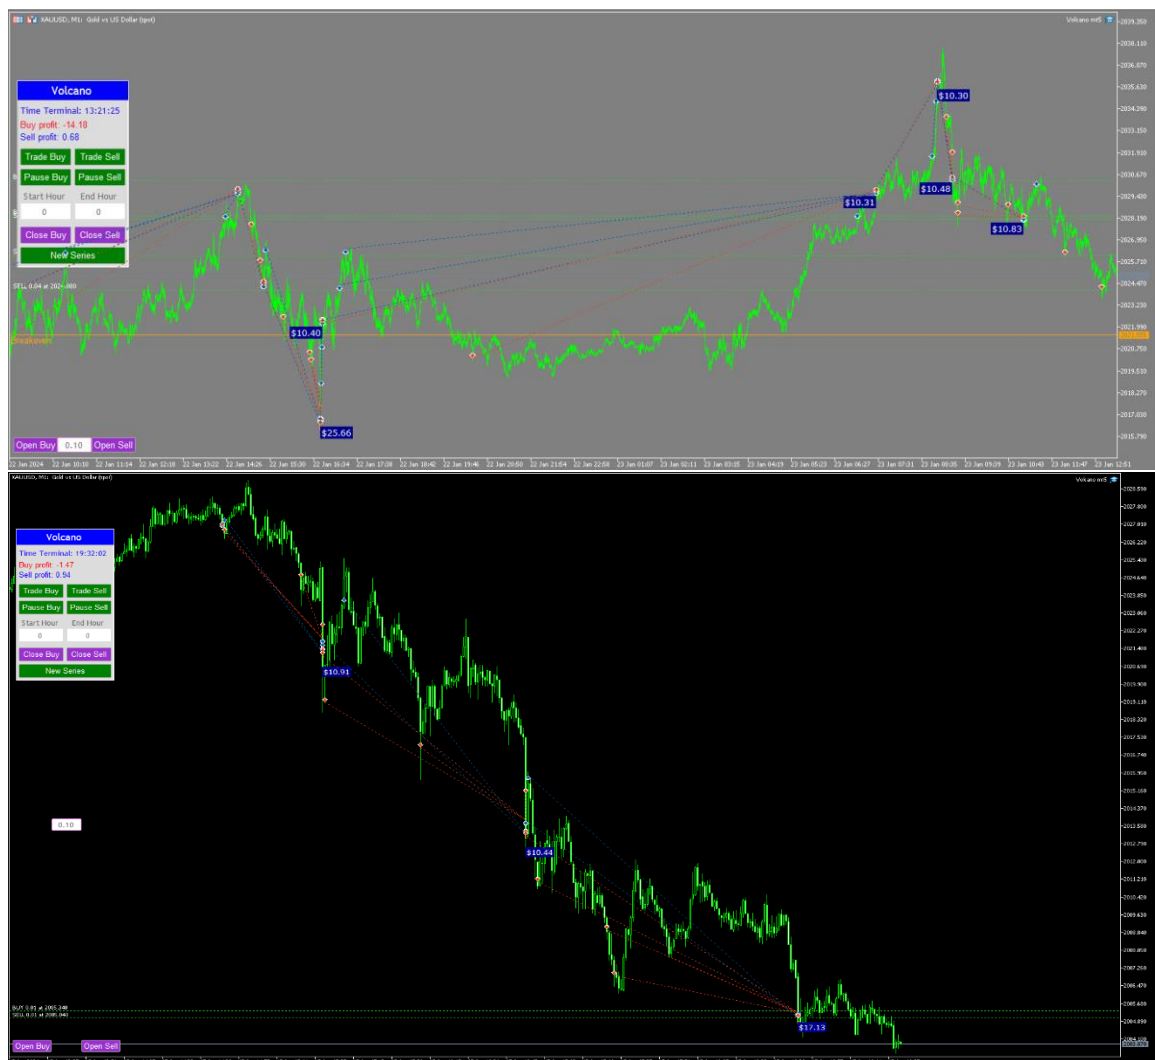

For Mt4: Go to “File”; “Open Data folder”; MQL4; “Presets” and drop your set files there

4. Load the set file by opening up the settings and click on “Load” and select the set file in the presets folder

Example of a trades of Volcano trading

PS: You can adjust the TP to 10 which is \$10 in money (not in pips) to take profit quickly. You can also add more trades if you are sure about the direction of gold then it will hit TP quickly. This way you can either control the EA manually or let it run on auto. You don't

need to use the set files, but make sure that there is no Stop Loss and the multiplier must always be 2!
