

Trading with My System

....This Post will be constantly updated....

Hi!

Everyone,

We all are here in this forum, because we all are **forex traders**, and we are trading this world's largest market.

There are many members in this forum who are **new**, & doesn't know **exactly** how to trade this market and they are consistently losing and blowing their accounts.

Most of them have urge me to help them with their trading or share my trading system with them.

I wanted to release this thread much earlier, but i wasn't able to do that because i had no time, but now i have made my decision and will share all the knowledge that i have in a most simple manner so that every trader is benefited and even the new traders could understand it.

So, in this thread I will share my **Trading Experience** and **Trading System** with you all and will show you my exact style of trading.

Who I am :-

I am a trader who is trading the forex market for more than **4 years** now, and currently the **moderator** of this forum and i am an **intraday trader** who likes to open and close my position within the **same** day.

You should Know :-

You should know that no one is **perfect** and even the **pro traders analysis are wrong and they too have bad trades...**

The **success** in forex market depends on the **profit/loss ratio**, so to **succeed** you should see that you are able to pick more **profitable trades and minimize loss as much as possible...**

How The System Works :-

Works on:- M30, M15, M5. (Best on **M15**)

The System works on All Time-Frames but i recommend you to trade it on **M15** because as an intraday trader you will get 1-3 entries daily and the price action will be less than that is on **M5**.

It uses **Trend Trading Strategy** and gives signal for **Trend Breakouts** and **Trend Retracement Breakouts**.

Though no system is **100%** accurate and every indicator gives false signal that is why I have designed this system in such a way that we will trade in **M15** and will confirm our entry with two higher TF's **H1** and **H4**. So, our entry will be **more accurate** and we will get **very less false entry**. So, this system is able to give you a **Profit Ratio** of more than **85%-90%** (which is very High compared to other systems.)

Indicators Used:-

- 1.) **Moving Average (5) with shift of 2**, to make it a leading indicator.
- 2.) **Pivot Points Daily** shows daily support and resistance points.
- 3.) **Heiken Ashi Candles**.
- 4.) **Arrow indicator** indicates sentiment of market has been changed.
- 5.) **GP_Macd (H1)** shows Trend's strength in **H1**.
- 6.) **GP_Stochastic (H1)** shows that trend is in overbought or oversold area .
- 7.) **GP_Macd (H4)** shows Trend's strength in **H4**.
- 8.) **GP_Major Trend (H4)** shows current Trend in **H4**.
- 9.) **Genesis Matrix (M15)** gives signals to enter the market.

My Systems Image Showing all the indicators :-

Note :- None of the indicator repaints, all are good leading indicators.

For Entry Rules (Buy and Sell) Refer the Following Post:-

Following are the Rules for Enter and Exit for this system, and as we have updated our system so here are the new Updated Rules, Refer the Following Post and get Updated with New Rules.

With This System you are Not Trading on the **M15 Timeframe**, you are Actually Trading on **H1 Timeframe**, remember following 3 Things:-

- 1.) You are actually Trading on H1 Timeframe, H1 is Your Setup Chart.....**
- 2.) H4 TimeFrame is your Direction Chart or Major Trend Chart.....**
- 3.) For Entry you will refer M15 TimeFrame as it is our Trigger Chart.....**

First, you will load the template on your **M15 Timeframe**, Now,

New Rules for Enter and Exit of this System:-

Enter Long (Buy):-

Follow the Order,

1.) First, If you will see that **GP-Sochastics (H1)** is moving out of **Oversold Area (20-30)** and **Yellow line is above Magenta line** and **GP_Macd (H1)** is **Blue** And, the **Signal will be Valid** if **H1 Bar is Closed** i.e a **Green Vertical Line** **Appears.....**Then, Only You Should **Take the Signal** as**Positive & Valid for Going Long.**

2.)Second, When You get the **First Signal as Positive** for Going **Long** then you should go for **Confirmation To Higher Timeframe** i.e **H4**, and Should Enter with the **Direction of H4**, Therefore, you will see that is **GP_Major Trend (H4)** is **Bullish** i.e **Yellow Line** is above **Magenta Line** and **GP_Macd (H4)** is **Blue.....**Again, The **Signal will be valid** only when the **H4 Candle is Closed.(When Vertical Green Line Appears)**

3.)Third, Now if the **First two Signals are Valid** after the **Close of H1 and H4 Bars**, Then you should Now **Find an Entry** on **M15 Timeframe**, And,**Genesis Matrix (M15)** will give you a **Perfect Entry, Enter** when All the **Four Dots** are **Blue.**

Enter Short (Sell):-

Follow the Order,

1.) First, If you will see that **GP-Sochastics (H1)** is moving out of **OverBought Area (80-70)** and **Magenta line is above Yellow line** and **GP_Macd (H1)** is **Red** And, the **Signal will be Valid** if **H1 Bar is Closed** i.e a **Green Vertical Line** **Appears.....**Then, Only You Should **Take the Signal** as**Positive & Valid for Going Short.**

2.) Second, When You get the **First Signal as Positive** for Going **Short** then you should go for **Confirmation To Higher Timeframe** i.e **H4**, and Should Enter with the **Direction of H4**, Therefore, you will see that is **GP_Major Trend (H4)** is **Bearish** i.e **Magenta Line** is above **Yellow Line** and **GP_Macd (H4)** is **Red**.....Again, The **Signal will be valid** only when the **H4 Candle is Closed.(When Vertical Green Line Appears)**

3.) Third, Now if the **First two Signals are Valid** after the **Close of H1 and H4 Bars**, Then you should Now **Find an Entry** on **M15 Timeframe**, And, **Genesis Matrix (M15)** will give you a **Perfect Entry, Enter** when All the **Four Dots are Red**.

Exit:-

We will exit or target the nearest **pivot point. (- 8 pips)**. Though this depends on the **trend strength** if the trend is **stronger** and you have reached the pivot point you **targeted** and the **trend is still strong** then you can target the **next pivot point**.

Thus, you will be Able to **Trade** According to the **H1 Timeframe**, Follow **Direction of H4 Timeframe** and **Trigger Entry** on **M15 TimeFrame** From the Same Chart with the Help of my Indicators and There will be Less Confusion and You will get a Right Entry.

Note:- You Should **Enter** in the Market **as much close as you can** towards the

..... **Yellow Moving Average (5)**.

Exception to the Rules Of Entry and Exit :-

There is an Exception to the Rules of Entry and Exit as stated above, only when the market is expecting a **Reversal**, so that we can catch a good amount of move if the market reverses.

Refer the Following Post to Know the Rules of Entry and Exit when the market is expecting a Reversal or a Reversal is in Place.

Rules for Enter and Exit When Market is Expecting a Reversal:-

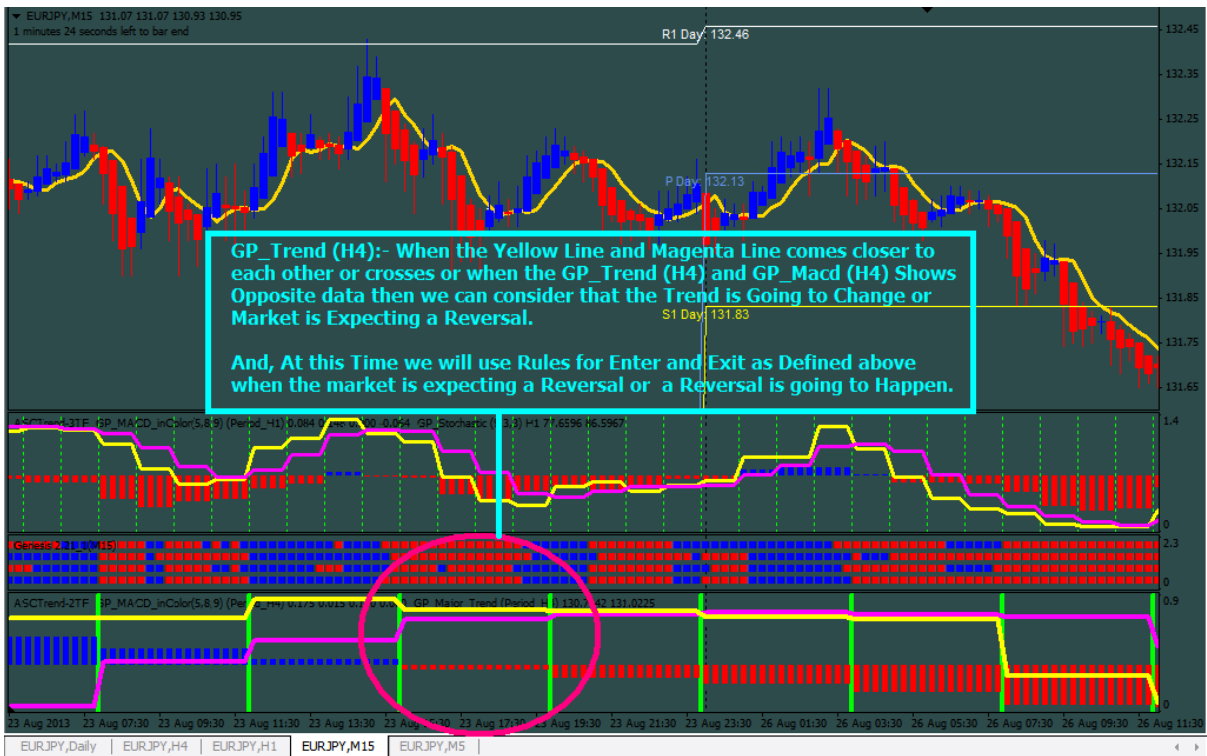

In this Case, I uses **Synchronization Technique** and I will explain to you all how it works...

First of all, this happens only if we are expecting a **Reversal or a Reversal is going to happen**, you can predict a reversal is going to happen by seeing the **H4 indicators** that is **GP_Macd(H4)** and **GP_Trend(H4)** both will show **opposite data** i.e in your case....**GP_Macd (H4) is Bullish** and **GP_Trend(H4) is bearish** (i.e Magenta line is Above Yellow).

So, in this case, if **GP_Sochastics (H1)** are moving out of Oversold area 20-30 and **Yellow line is Above Magenta Line** and **Genesis(M15)** is giving all **four dots blue**(white in your template) then i think that you should enter that trade without confirming direction from **H4 timeframe**.....But if you did you so then you will be in the trade only till **Sochastics of H1** are **valid** (i.e **Yellow line is Above Magenta Line** and if it **crosses** then you will have **exit** that trade) and also till the **Matrix is in place** i.e all four dots are blue. And, the **Same Conditions Applies** When you want to **Sell** the pair.

But once, **H4 Bar Closes** and we gets clear direction i.e in **GP_Trend (H4)** and **GP_Macd (H4)** Boths shows **similar data** then we will **Enter and Exit** according to the **Rules** I have stated before or the **Rules** which are present in the **Main Post**.

How to Detect a Trend Change or a Reversal:-

Now, the Most Frequently Asked Question for this System....

Q: What to do if the **GP_Sochastics (H1)** Goes in Oversold or Overbought area??

A: If the **GP_Sochastics (H1)** Goes in Oversold or Overbought area then we should **exit** the trade immediately only if the direction of major trend i.e **GP_Trend (H4)** is **not** Confirm or the market is Expecting a Reversal i.e **GP_Macd (H4)** and **GP_Trend (H4)** are showing Opposite data.

But if the Trend Direction is **Confirmed** i.e **GP_Trend (H4)** and **GP_Macd (H4)** are showing same data after the **close of H4 bar** then you should remain in the trade and lock your profits to a certain level and see what happens next the price moves forward and reaches your target or reverses back to hit your profitable stoploss.....Anyway, you will be profitable but this method will help you to get **maximum** profits.

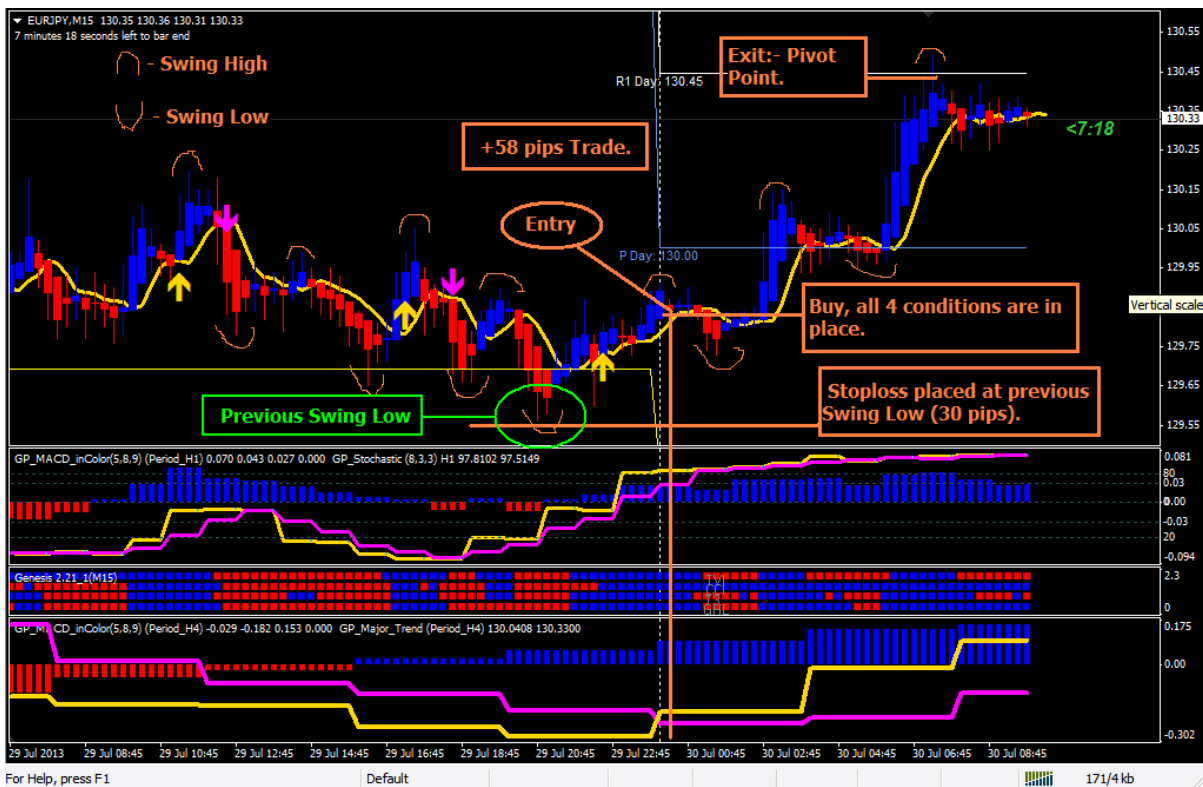

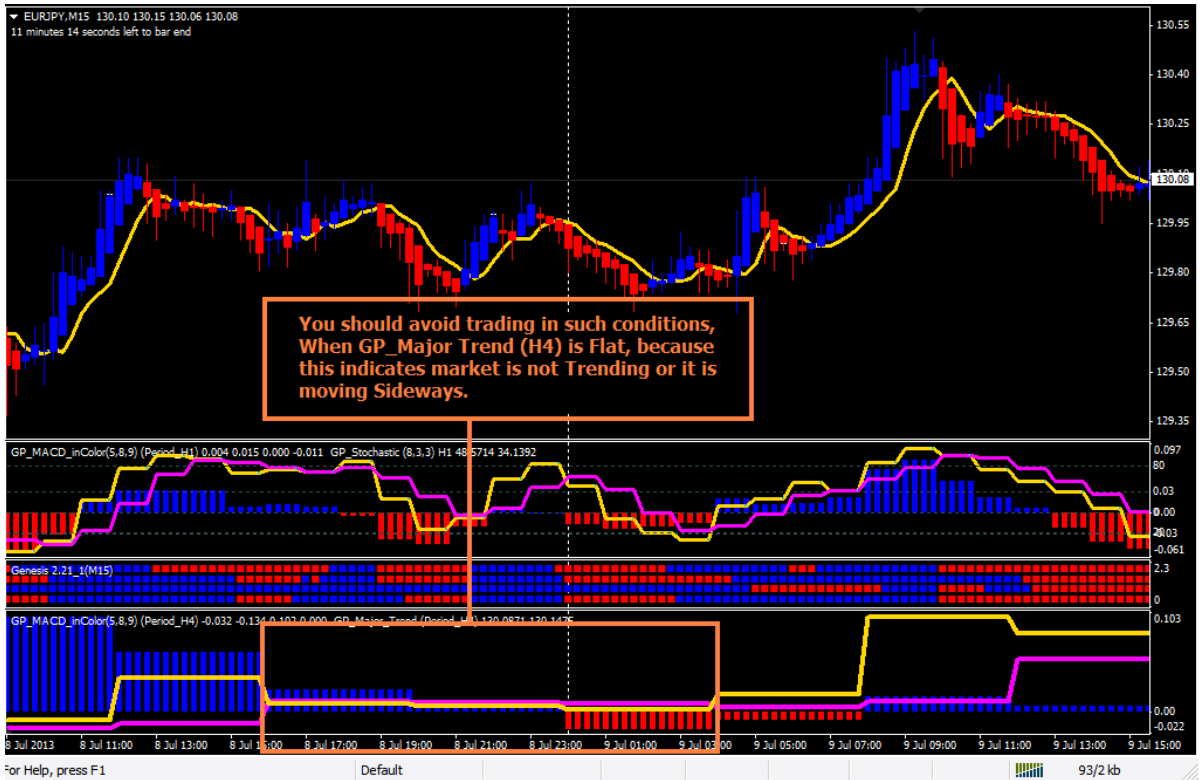

Note:- Always, Try to lock your profits when the trade moves in +20 pips to Breakeven.

Exit :-

We will exit or target the nearest **pivot point. (- 8 pips)**. Though this depends on the **trend strength** if the trend is **stronger** and you have reached the pivot point you **targeted** and the **trend is still strong** then you can target the **next pivot point** but **don't forget to lock your profits.**

Stoploss:-

-+ 5 pips of Previous **Swing High** or Previous **Swing Low.**

MFx MONEY MANAGEMENT STRATEGY :-

Rules of the system:-

1.) How much lot size you should trade ----> You should open a lot size in such a manner that you have **1000 pips** left in your account

For eg:-

0.1 Lot for \$100

0.5 Lot for \$500

1.0 Lot for \$1000

1.1 Lot for \$1100and so on. And one trade at a time. (Strictly).

****:-** You can use **two trades** at a time only if you have **2000 pips** left in your account and that is as follows:-

\$2000 then you can trade as :-

Trade 1.) 1 Lot = 1000 pips

Trade 2.) 1 Lot = 1000 pips

.
. .
. .
. .

and so on.

2.) You should always place a **Stoploss** and stoploss should be place in such a way that you only loose **2-3%** of your **capital** if it is hit.

3.) Move your **Stoploss to breakeven** when you gain the profit as much as your stoploss.

For example:- If you are trading on **M15 timeframe** and you place a stoploss of **25 pips** and then you gained **more than 25 pips** then move your stoploss to the **price where you opened the position (Breakeven)**. So, if the trade reverses back then

you will have **no loss**.

4.) After you move your stoploss to breakeven then **you have lift your Only one trade rule and you have the access to trade one more trade of the same lot size.** You can trade with the same pair you trade earlier if you think that the signal is strong or you can even trade it on another pair.

Thus, MFX MONEY MANAGEMENT STRATEGY Doubles your chances of profit with only 2-3% of risk.
