How my monitor works

You have to open a chart for every time frame and pair you want to monitor on the same platform and attach the KOR indicator to it (for example("KorHarmonics v 6.7.11") , in the inputs make sure "bextSigMonitonitoringON" is set to "true" (this is found in the "Signal Monitoring ON" section of the inputs).......I save it as a template at this point and apply it to all the charts and time frames I want to monitor.

Then just set up a chart on any pair and any time frame (I use GBPUSD H1) and add the indicator "KorSigMonitor"

In this indicator all you have to do is set up what pairs you want to trade and the time frames you want to monitor...its pretty easy, just add or remove what you want to monitor for pairs and time frames in the inputs of this indicator.

I have included two template to make it easier.

Use" ab setup for monitor" on every chart (see picture called Monitor 001)

Use "Chart monitor" once for the monitor

I then open the monitor to full screen and then when I get an alert I go to the chart.
